Contents

Chapter 1

GEFP-EOP

GEFP Project

The package is designed for quantum chemistry calculations Currently, the implemented methods are:

- Density-Based decomposition of Mandado and Hermida-Ramon

- Reduced Variational Scheme of Fink et. al

The tutorial is under preparation.

Installation

Installation prerequisites:

- Python 3.3 or newer

- NumPy module for Python, 1.16.3 or newer

- SciPy module for Python, 1.2.1 or newer

- Psi4 1.2.0 or newer

- EOP-Dev 1.0.3 or newer

To install the GEFP package type the following commands:

```
sudo python setup.py install
```

Chapter 2

Copyright © 2012, Bartosz Błasiak (blasiak.bartosz@gmail.com)

to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

1. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

    ```
    a) The modified work must itself be a software library.

    b) You must cause the files modified to carry prominent notices
    stating that you changed the files and the date of any change.

    c) You must cause the whole of the work to be licensed at no
    charge to all third parties under the terms of this License.

    d) If a facility in the modified Library refers to a function or a
    table of data to be supplied by an application program that uses
    the facility, other than as an argument passed when the facility
    is invoked, then you must make a good faith effort to ensure that,
    in the event an application does not supply such function or
    table, the facility still operates, and performs whatever part of
    ```

```
        its purpose remains meaningful.

        (For example, a function in a library to compute square roots has
        a purpose that is entirely well-defined independent of the
        application.  Therefore, Subsection 2d requires that any
        application-supplied function or table used by this function must
        be optional: if the application does not supply it, the square
        root function must still compute square roots.)
```

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

1. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

   Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

1. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

1. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

1. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

```
a) Accompany the work with the complete corresponding
machine-readable source code for the Library including whatever
changes were used in the work (which must be distributed under
Sections 1 and 2 above); and, if the work is an executable linked
with the Library, with the complete machine-readable "work that
uses the Library", as object code and/or source code, so that the
user can modify the Library and then relink to produce a modified
executable containing the modified Library.  (It is understood
that the user who changes the contents of definitions files in the
Library will not necessarily be able to recompile the application
to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the
Library.  A suitable mechanism is one that (1) uses at run time a
copy of the library already present on the user's computer system,
rather than copying library functions into the executable, and (2)
will operate properly with a modified version of the library, if
```

```
the user installs one, as long as the modified version is
interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at
least three years, to give the same user the materials
specified in Subsection 6a, above, for a charge no more
than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy
from a designated place, offer equivalent access to copy the above
specified materials from the same place.

e) Verify that the user has already received a copy of these
materials or that you have already sent this user a copy.
```

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

1. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

   ```
   a) Accompany the combined library with a copy of the same work
   based on the Library, uncombined with any other library
   facilities.  This must be distributed under the terms of the
   Sections above.

   b) Give prominent notice with the combined library of the fact
   that part of it is a work based on the Library, and explaining
   where to find the accompanying uncombined form of the same work.
   ```

2. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

3. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

4. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

5. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

1. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

2. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

1. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software

Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

<div align="center">NO WARRANTY</div>

2. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

3. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

<div align="center">END OF TERMS AND CONDITIONS</div>

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year>  <name of author>

This library is free software; you can redistribute it and/or
modify it under the terms of the GNU Lesser General Public
License as published by the Free Software Foundation; either
version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public
License along with this library; if not, write to the Free Software
Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA
```

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of="" ty="" coon>="">, 1 April 1990 Ty Coon, President of Vice

That's all there is to it!

Chapter 3

Introduction

Exploring biological phenomena at molecular scale is oftentimes indispensable to develop new drugs and intelligent materials.

Most of relevant system properties are affected by intermolecular interactions with nearby environment such as solvent or closely bound electronic chromophores. Studying such molecular aggregates requires rigorous and accurate quantum chemistry methods, the cost of which grows very fast with the number of electrons. Despite many methodologies have been devised to describe energetic and dynamical properties of **extended molecular systems** efficiently and accurately, there exist particularly difficult cases in which modelling is still challenging:

- describing electronic transitions in solution or

- when coupled with other electronic transition via resonance energy transfer,

- performing molecular dynamics at very high level of theory including dynamic electron correlation,

- vibrational frequency calculations of particular normal mode in condensed phases

and so on. The reason behind (sometimes prohibitively) high costs of fully *ab initio* calculations in the above areas is the complexity of mathematical models often based on wave functions rather then (conceptually more straightforward) electronic densities. On the other hand, it has been pointed out before that the one-electron density distributions are of particular importance in chemistry. It can be thus utilized as a means of developing a general model that re-expresses the physics of intermolecular interactions in terms of effective one-electron functions that are easier to handle in practice.

This Project will focus on finding a unified way to simplify various equations of Quantum Chemistry of extended molecular systems, i.e., molecular aggregates such as interacting chromophores and molecules solvated by water and other solvents. Indeed, one of the important difficulties encountered in Quantum Chemistry of large systems is the need of evaluation of special kind of numbers known as *electron repulsion integrals*, or in short, ERI's. In a typical calculation, the amount of ERI's can be as high as tens or even hundreds of millions (!) that unfortunately prevents from application of conventional methods when the number of particles in question is too large. In the Project, the complicated expressions involving ERI's shall be greatly simplified to reduce the computational costs as much as possible while introducing no or minor approximations to the original theories.

3.1 Research Project Methodology

In this Project the new theoretical protocol based on the one-electron effective potentials (OEP's) is developed. The main principle is to rewrite arbitrary sum of functions f of electron repulsion integrals (ERI's) by defining OEP's according to the following general prescription:

$$\sum_f f\left[\left(\phi_i^A \phi_j^A || \phi_k^B \phi_l^B\right)\right] = \left(\phi_i^A | v_{kl}^B | \phi_j^A\right) \rightarrow \text{ point charge or density fitting}$$

$$\sum_f f\left[\left(\phi_i^A \phi_j^B || \phi_k^B \phi_l^B\right)\right] = \left(\phi_i^A | v_{kl}^B | \phi_j^B\right) \rightarrow \text{ density fitting,}$$

where A and B denote different molecules and ϕ_i is the i-th molecular orbital or basis function. Here, v_{kl}^B denotes the List of One-Electron Potentials *ab initio* "OEP matrix element". The technique described above will be applied to simplify expressions for

- short-range excitation energy transfer couplings between chlorophyll subunits of reaction centres in photosynthesis

- Pauli interaction repulsion energy

- charge-transfer interaction energy

- electric field-induced charge density polarization of molecules.

The above developments might be used in fragment-based *ab initio* molecular dynamics protocols of new generation.

3.2 Expected Impact on the Development of Science, Civilization and Society

The proposed OEP's are expected to significantly develop the fragment-based methods that are widely used in physical chemistry and modelling of biologically important systems. Owing to universality of OEP's, they could find applications in many branches of chemical science: non-empirical∗ molecular dynamics, short-range resonance energy transfer in photosynthesis, electronic and vibrational solvatochromism, multidimensional spectroscopy and so on. In particular:

- the OEP-based models of Pauli repulsion energy and charge-transfer (CT) energy could be used to improve the computational performance of the second generation effective fragment potential method (EFP2). At present, the CT term is very time consuming and due to this reasons it is not used in most of applications of EFP2 to perform molecular dynamics simulations.

- the OEP-based model of EET couplings could significantly improve modelling of energy transfer in the light harvesting complexes. At present, short-range phenomena (Dexter mechanisms of EET) are very difficult to efficiently and quantitatively asses when performing statistical averaging and applying to large molecular aggregates. Such Dexter effects could be computed by using OEP's in much more efficient manner without loosing high accuracy of parent TDFI-TI method.

- the density matrix polarization (DMS) tensors could be used in new generation fragment-based *ab initio* molecular dynamics protocols that rigorously take into consideration electron correlation effects.

Therefore, it is strongly believed that the OEP's could have an indirect impact on the design of novel drugs and materials for industry.

3.3 The OEPDev Code

To pursue the above challenges in the field of computational quantum chemistry of extended molecular aggregates, the OEPDev platform is developed. Accurate and efficient *ab initio* models based on OEP's are implemented in the OEPDev code, along with the state-of-the-art benchmark and competing methods. Written entirely in C++, OEPDev is a plugin to Psi4 quantum chemistry package. Therefore, compilation and running the OEPDev code is straightforward and follows the API interface similar to the one used in Psi4 with just a few specific programing conventions. The detailed discussion about using the OEPDev code can be found in advanced usage section.

Chapter 4

OEP Design.

OEP (One-Electron Potential) is associated with certain quantum one-electron operator $\hat{v}^A$ that defines the ability of molecule A to interact in a particular way with other molecules.

Technically, OEP can be understood as a **container object** (associated with the molecule in question) that stores the information about the above mentioned quantum operator. Here, it is assumed that similar OEP object is also defined for all other molecules in a molecular aggregate.

In case of interaction between molecules A and B, OEP object of molecule A interacts directly with wavefunction object of the molecule B. Defining a Solver class that handles such interaction Wavefunction class and OEP class

the universal design of OEP-based approaches can be established and developed.

> **Important:** OEP and Wavefunction classes should not be restricted to Hartree-Fock; in generall any correlated wavefunction and derived OEP's should be allowed to work with each other.

4.1   OEP Classes

There are many types of OEP's, but the underlying principle is the same and independent of the type of intermolecular interaction. Therefore, the OEP's should be implemented by using a multi-level class design. In turn, this design depends on the way OEP's enter the mathematical expressions, i.e., on the types of matrix elements of the one-electron effective operator $\hat{v}^A$.

4.1.1   Structure of possible OEP-based expressions and their unification

Structure of OEP-based mathematical expressions is listed below:

Type	Matrix Element	Comment
Type 1	$\left(I\|\hat{v}^A\|J\right)$	$I \in A,\ J \in B$
Type 2	$\left(J\|\hat{v}^A\|L\right)$	$J, L \in B$

In the above table, I, J and K indices correspond to basis functions or molecular orbitals. Basis functions can be primary or auxiliary OEP-specialized density-fitting. Depending on the type of function and matrix element, there are many subtypes of resulting matrix elements that differ in their dimensionality. Examples are given below:

Matrix Element	DF-based form	ESP-based form
$\left(\mu\lvert\hat{v}^{A[\mu]}\rvert\sigma\right)$	$\sum_{\iota\in A} v^A_{\mu\iota} S_{\iota\sigma}$	$\sum_{\alpha\in A} q^{A[\mu]}_\alpha V^{(\alpha)}_{\mu\sigma}$
$\left(i\lvert\hat{v}^{A[i]}\rvert j\right)$	$\sum_{\iota\in A} v^A_{i\iota} S_{\iota j}$	$\sum_{\alpha\in A} q^{A[i]}_\alpha V^{(\alpha)}_{ij}$
$\left(j\lvert\hat{v}^{A[i]}\rvert l\right)$	$\sum_{\iota\kappa\in A} S_{j\iota} v^{A[i]}_{\iota\kappa} S_{\kappa l}$	$\sum_{\alpha\in A} q^{A[i]}_\alpha V^{(\alpha)}_{jl}$

In the formulae above, the OEP-part (stored by OEP instances) and the Solver-part (to be computed by the Solver) are separated. It is apparent that all OEP-parts have the form of 2nd- or 3rd-rank tensors with different class of axes (molecular orbitals, primary/auxiliary basis, atomic space). Therefore, they can be uniquely defined by a unified *tensor object* (storing double precision numbers) and unified *dimension object* storing the information of the axes classes.

In Psi4, a perfect candidate for the above is `psi4::Tensor` class declared in `psi4/libthce/thce.h`. Except from the numeric content its instances also store the information of the dimensions in a form of a vector of `psi4::Dimension` instances.

Another possibility is to use `psi::Matrix` objects, instead of `psi4::Tensor` objects, possibly putting them into a `std::vector` container in case there is more than two axes.

Chapter 5

List of One-Electron Potentals

Here I provide the list of OEP's that have been already derived within the scope of the OEPDev project.

Note

> Add here a table with all the OEP types along with their symbols used in the OEPDev code (e.g., `Murrell.etal-S1` etc).

5.1 Electrostatic Energy OEP's

For electrostatic energy calculations, OEP is simply the electrostatic potential due to nuclei and electrons.

3D form:

$$v(\mathbf{r}) = \sum_x \frac{Z_x}{|\mathbf{r} - \mathbf{r}_x|} + \sum_{\mu\nu \in A} P_{\nu\mu} \int d\mathbf{r}' \frac{\phi_\mu^*(\mathbf{r}')\phi_\nu(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|}$$

Matrix form:

$$v_{ik} = \sum_{x \in A} Z_x V_{ik}^{(x)} + \sum_{\mu\nu \in A} P_{\nu\mu} (\mu\nu|ik)$$

5.2 Pauli Repulsion OEP's

The following potentials are derived for the evaluation of the Pauli repulsion energy based on Murrel's expressions.

5.2.1　First-order contribution in overlap matrix expansion.

This contribution is simply the electrostatic potential coming from all nuclei and electron density except∗ from electron density from molecular orbital i that interacts with the generalized overlap density between i of molecule A and j of molecule B.

3D forms:

$$
v(\mathbf{r})_{S^{-1}}^{A[i]} = -\sum_{x \in A} \frac{Z_x}{|\mathbf{r} - \mathbf{r}_x|} + \sum_{\mu\nu \in A} \left\{ D_{\nu\mu} - C_{\mu i}^* C_{\nu i} \right\} \int d\mathbf{r}' \frac{\phi_\mu^*(\mathbf{r}')\phi_\nu(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|}
$$

Matrix forms:

$$
v_{\xi i}(S^{-1}) = \sum_{\kappa \in A} C_{i\kappa} \left\{ -\sum_{x \in A} V_{\kappa\xi}^{(x)} + \sum_{\mu\nu \in A} \left\{ D_{\nu\mu} - C_{\mu i}^* C_{\nu i} \right\} (\mu\nu|\xi\kappa) \right\}
$$

5.2.2　Second-order contribution in overlap matrix expansion.

To be added here!

5.3　Charge-Transfer Energy OEP's

To be added here!

5.4　Excitonic Energy Transfer OEP's

The following potentials are derived for the evaluation of the short-range EET couplings based on Fujimoto's TDFI-TI method.

5.4.1　ET contributions.

3D forms:

$$
v(\mathbf{r})_1^{A[\mu]} = -C_{\mu L}^* \sum_{x \in A} \frac{Z_x}{|\mathbf{r} - \mathbf{r}_x|} + \sum_{\nu\kappa \in A} \left\{ C_{\mu L}^* D_{\nu\kappa} - \frac{1}{2} C_{\nu L}^* D_{\mu\kappa} \right\} \int d\mathbf{r}' \frac{\phi_\nu^*(\mathbf{r}')\phi_\kappa(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|}
$$

$$
v(\mathbf{r})_2^{A[\mu]} = C_{\kappa H} \sum_{\nu\kappa \in A} \left\{ 2 C_{\nu L}^* C_{\mu H}^* - C_{\nu H}^* C_{\mu L}^* \right\} \int d\mathbf{r}' \frac{\phi_\nu^*(\mathbf{r}')\phi_\kappa(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|}
$$

$$
v(\mathbf{r})_3^{A[\mu]} = v(\mathbf{r})_1^{A[\mu]} + v(\mathbf{r})_1^{A[\mu]}
$$

Matrix forms:

$$
v_{\mu\xi}(1) = -C_{\mu L}^* \sum_{x \in A} V_{\mu\xi}^x + \sum_{\nu\kappa \in A} \left\{ C_{\mu L}^* D_{\nu\kappa} - \frac{1}{2} C_{\nu L}^* D_{\mu\kappa} \right\} (\nu\kappa|\mu\xi)
$$
$$
v_{\mu\xi}(2) = C_{\kappa H} \sum_{\nu\kappa \in A} \left\{ 2C_{\nu L}^* C_{\mu H}^* - C_{\nu H}^* C_{\mu L}^* \right\} (\nu\kappa|\mu\xi)
$$
$$
v_{\mu\xi}(3) = v_{\mu\xi}(1) + v_{\mu\xi}(2)
$$

5.4.2 HT contributions.

Do be derived.

5.4.3 CT contributions.

To be derived.

5.5 Full HF Interaction OEP's

The following potentials are derived for the evaluation of the full Hartree-Fock interaction energy based on the OEPDev equations.

Chapter 6

Density-fitting Specialized for OEP's

To get the ab-initio representation of a OEP, one can use a procedure similar to the typical density fitting or resolution of identity, both of which are nowadays widely used to compute electron-repulsion integrals (ERI's) more efficiently.

6.1   Fitting in Complete Space

An arbitrary one-electron potential of molecule *A* acting on any state vector associated with molecule *A* can be expanded in an *auxiliary space* centered on *A* as

$$v|i) = \sum_{\xi\eta} v|\xi)[\mathbf{S}^{-1}]_{\xi\eta}(\eta|i)$$

under the necessary assumption that the auxiliary basis set is *complete*. In a special case when the basis set is orthogonal (e.g., molecular orbitals) the above relation simplifies to

$$v|i) = \sum_{\xi} v|\xi)(\xi|i)$$

It can be easily shown that the above general and exact expansion can be obtained by performing a density fitting in the complete space. We expand the LHS of the first equation on this page in a series of the auxiliary basis functions scaled by the undetermined expansion coefficients:

$$v|i) = \sum_{\xi} G_{i\xi}|\xi)$$

which we shall refer here as to the matrix form of the OEP operator. By constructing the least-squares objective function

$$Z[\{G_\xi^{(i)}\}] = \int d\mathbf{r}_1 \left[v(\mathbf{r}_1)\phi_i(\mathbf{r}_1) - \sum_\xi G_\xi^{(i)} \varphi_\xi(\mathbf{r}_1) \right]^2$$

and requiring that

$$\frac{\partial Z[\{G_\xi^{(i)}\}]}{\partial G_\mu^{(i)}} = 0 \text{ for all } \mu$$

we find the coefficients $G_\xi^{(i)}$ to be

$$\mathbf{G}^{(i)} = \mathbf{v}^{(i)} \cdot \mathbf{S}^{-1}$$

where

$$v_\eta^{(i)} = (\eta|vi)$$
$$S_{\eta\xi} = (\eta|\xi)$$

or explitictly

$$G_{i\xi} = \sum_\eta [\mathbf{S}^{-1}]_{\xi\eta} (\eta|v|i)$$

identical to what we obtained from application of the resolution of identity in space spanned by non-orthogonal complete set of basis vectors.

Since matrix elements of an OEP operator in auxiliary space can be computed in the same way as the matrix elements with any other basis function, one can formally write the following identity

$$(X|v|i) = \sum_{\xi\eta} S_{X\xi} [\mathbf{S}^{-1}]_{\xi\eta} (\eta|v|i)$$

where X is an arbitrary orbital. When the other orbital does not belong to molecule A but to the (changing) environment, it is straightforward to compute the resulting matrix element, which is simply given as

$$(j_{\in B}|v^A|i_{\in A}) = \sum_\xi S_{j\xi} G_{i\xi}$$

where j denotes the other (environmental) basis function.

In the above equation, the OEP-part (fragment parameters for molecule A only) and the Solver-part (subject to be computed by solver on the fly) are separated. This then forms a basis for fragment-based approach to solve Quantum Chemistry problems related to the extended molecular aggregates.

6.2 Fitting in Incomplete Space

Density fitting scheme from previous section has practical disadvantage of a nearly-complete basis set being usually very large (spanned by large amount of basis set vectors). Any non-complete basis set won't work in the previous example. Since most of basis sets used in quantum chemistry do not form a complete set, it is beneficial to design a modified scheme in which it is possible to obtain the **effective** matrix elements of the OEP operator in a **incomplete** auxiliary space. This can be achieved by minimizing the following objective function

$$Z[\{G_\xi^{(i)}\}] = \iint d\mathbf{r}_1 d\mathbf{r}_2 \frac{\left[v(\mathbf{r}_1)\phi_i(\mathbf{r}_1) - \sum_\xi G_\xi^{(i)} \varphi_\xi(\mathbf{r}_1)\right]\left[v(\mathbf{r}_2)\phi_i(\mathbf{r}_2) - \sum_\xi G_\eta^{(i)} \varphi_\eta(\mathbf{r}_1)\right]}{|\mathbf{r}_1 - \mathbf{r}_2|}$$

Thus requesting that

$$\frac{\partial Z[\{G_\xi^{(i)}\}]}{\partial G_\mu^{(i)}} = 0 \text{ for all } \mu$$

we find the coefficients $G_\xi^{(i)}$ to be

$$\mathbf{G}^{(i)} = \mathbf{b}^{(i)} \cdot \mathbf{A}^{-1}$$

where

$$b_\eta^{(i)} = (\eta||vi)$$
$$A_{\eta\xi} = (\eta||\xi)$$

The symbol $||$ is to denote the operator r_{12}^{-1} and double integration over $\mathbf{r}_1$ and $\mathbf{r}_2$. Thus, it is clear that in order to use this generalized density fitting scheme one must to compute two-centre electron repulsion integrals (implemented in oepdev::ERI_1_1) as well as four-centre asymmetric electron repulsion integrals of the type $(\alpha\beta\gamma||\eta)$ (implemented in oepdev::ERI_3_1).

Chapter 7

Implemented Models

7.1   Target Properties

Detailed list of models which is to be implemented in the OEPDev project is given below:

Table 1. Models subject to be implemented and analyzed within oep-dev.

Pauli energy	Induction energy	EET Coupling
EFP2-Pauli	EFP2-Induced Dipoles	TrCAMM
Murrel et al.'s theory	Density Susceptibility	OEP-ET/HT
OEP-Murrel et al.'s		TDFI-TI
		FED
Exact (Stone's)	Exact (incl. CT)	Exact (ESD)

7.2   Target, Benchmark and Competing Models

The target models introduced in the Project shall be tested against the following benchmarks and compared with the following state-of-the-art models:

Table 2. Target models vs benchmarks and competitor models.

Target Model	Benchmarks	Competing Model
OEP-Murrel et al.'s	Murrel et al.'s	EFP2-Pauli
	Exact (Stone's)	
OEP-ET/HT + TrCAMM	Exact (ESD)	TDFI-TI
	FED	FED
	TDFI-TI	
Density Susceptibility	Exact (incl. CT)	EFP2-Induced Dipoles

Chapter 8

Contributing to OEP-Dev

OepDev is a plugin to Psi4.

Therefore it should follow the programming etiquette of Psi4. Also, oep-dev has additional programming tips to make the code more versatile and easy in further development. Here, I emphasise on most important aspects regarding the **programming rules**.

8.1 Main routine and libraries

Oep-dev has only *one* source file in the plugin base directory, i.e., `main.cc`. This is the main driver routine that handles the functionality of the whole OEP testing platform: specifies options for Psi4 input file and implements test routines based on the options. Include files directly related to `main.cc` are stored in the `include` directory, where only header files are present. Options are specified in `include/oepdev_options.h` whereas macros and defines in `include/oepdev_files.h`. Other sources are stored in `MODULE/libNAME*` directories where `NAME` is the name of the library with sources and header files, whereas `MODULE` is the directory of the oep-dev module.

Things to remember:

1. **No other sources in base directory.** It is not permitted to place any new source or other files in the plugin base directory (i.e., where `main.cc` resides).

2. **Sources in library directories.** Any additional source code has to be placed in `oepdev/libNAME*` directory (either existing one or a new one; in the latter case remember to add the new `*.cc` files to `CMakeLists.txt` in the plugin base directory.

3. **Miscellanea in special directories.** If you want to add additional documentation, put it in the `doc` directory. If you want to add graphics, put it in the `images` directory.

8.2 Header files in libraries

Header files are handy in obtaining a quick glimpse of the functionality within certain library. Each library directory should contain at least one header file in oep-dev. However, header files can be problematic if not managed properly.

Things to remember:

1. **Header preprocessor variable**. Define the preprocessor variable specyfying the existence of include of the particular header file. The format of such is

   ```
   #ifndef MODULE_LIBRARY_HEADER_h
   #define MODULE_LIBRARY_HEADER_h
   // rest of your code goes here
   #endif // MODULE_LIBRARY_HEADER_h
   ```

   Last line is the **end** of the header file. The preprocessor variables represents the directory tree `oepdev/MODULE/LIBRARY/HEADER.h` structure (where `oepdev` is the base plugin directory). `MODULE` is the plugin module name (e.g. `oepdev`, the name of the module directory) `LIBRARY` is the name of the library (e.g. `libutil`, should be the same as library directory name) `HEADER` is the name of the header in library directory (e.g. `diis` for `diis.h` header file)

2. **Set module namespace**. To prevent naming clashes with other modules and with Psi4 it is important to operate in separate namespace (e.g. for a module).

   ```
   namespace MODULE {
   // your code goes here
   } // EndNameSpace MODULE
   ```

   For instance, all classes and functions in `oepdev` module are implemented within the namespace of the same label. Considering addition of other local namespaces within a module can also be useful in certain cases.

8.3 Environmental variables

Defining the set of intrinsic environmental variables can help in code management and conditional compilation. The oep-dev environmental variables are defined in `include/oepdev_files.h` file. Remember also about psi4 environmental variables defined in `psi4/psifiles.h` header. As a rule, the oep-dev environmental variable should have the following format:

`OEPDEV_XXXX`

where `XXXX` is the descriptive name of variable.

8.4 Documenting the code

Code has to be documented (at best at a time it is being created). The place for documentation is always in header files. Additional documentation can be also placed in source files. Leaving a chunk of code for a production run without documentation is unacceptable.

Use Doxygen style for documentation all the time. Remember that it supports markdown which can make the documentation even more clear and easy to understand. Additionally you can create a nice `.rst` documentation file for Sphinx program. If you are coding equations, always include formulae in the documentation!

Things to remember:

1. **Descriptions of classes, structures, global functions, etc**. Each programming object should have a description.

2. **Documentation for function arguments and return object**. Usage of functions and class methods should be explained by providing the description of all arguments (use `\param` and `\return` Doxygen keywords).

3. **One-line description of class member variables**. Any class member variable should be preceded by a one-liner documentation (starting from `///`).

4. **Do not be afraid of long names in the code**. Self-documenting code is a bless!

8.5 Naming conventions

Naming is important because it helps to create more readable and clear self-documented code.

Some loose suggestions:

1. **Do not be afraid of long names in the code, but avoid redundancy**. Examples of good and bad names: good name: `get_density_matrix`; bad name: `get_matrix`. Unless there is only one type of matrix a particular objects can store, `matrix` is not a good name for a getter method. good name: `class Wavefunction`, bad name: `class WFN` good name: `int numberOfErrorVectors`, bad name: `int nvec`, bad name: `the_number_of_error_vectors` good name: `class EFPotential`, probably bad name: `class EffectiveFragmentPotential`. The latter might be understood by some people as a class that inherits from `EffectiveFragment` class. If it is not the case, compromise between abbreviation and long description is OK.

2. **Short names are OK in special situations**. In cases meaning of a particular variable is obvious and it is frequently used in the code locally, it can be named shortly. Examples are: `i` when iterating `no` number of occupied orbitals, `nv` number of virtual orbitals, etc.

3. **Clumped names for variables and dashed names for functions**. Try to distinguish between variable name like `sizeOfOEPTypeList` and a method name `get_matrix()` (neither `size_of_OEP_type_list`, nor `getMatrix()`). This is little bit cosmetics, but helps in managing the code when it grows.

4. **Class names start from capital letter**. However, avoid only capital letters in class names, unless it is obvious. Avoid also dashes in class names (they are reserved for global functions and class methods). Examples: good name: `DIISManager`, bad name: `DIIS`. good name: `EETCouplingSolver`, bad name: `EETSolver`, very bad: `EET`.

8.6 Track timing when evaluating the code

It is useful to track time elapsed for performing a particular task by a computer. For this, use `psi::timer_on` and `psi::timer_off` functions defined in `psi4/libqt/qt.h`. Psi4 always generates the report file `timer.dat` that contains all the defined timings. For example,

```
#include "psi/libqt/qt.h"
psi::timer_on("OEP    E(Paul) Murrell-etal S1  ");
// Your code goes here
psi::timer_off("OEP    E(Paul) Murrell-etal S1  ");
```

To maintain the printout in a neat form, the timing associated with the OEPDev code should be generated via `misc/python/timing.py` utility script.

8.7 Clean memory between independent jobs

If you use scratch disk space to store integrals, clean the scratch in between independent calculations. From C++ level invoke

```
#include "psi4/libpsio/psio.hpp"
// ...
psi::PSIOManager::shared_object()->psiclean();
```

whereas from the Python level use

```
import psi4
# ..
psi4.core.clean()
```

If the scratch space is not cleaned up before next independent task begins, certain computational routines might crash with `PSIOError` or continue without error, but produce wrong results.

8.8 Use Object-Oriented Programming

Try to organise your creations in objects having special relationships and data structures. Encapsulation helps in producing self-maintaining code and is much easier to use. Use:

- **factory design** for creating objects

- **container design** for designing data structures

- **polymorphysm** when dealing with various flavours of one particular feature in the data structure

  Note: In Psi4, factories are frequently implemented as static methods of the base classes, for example `psi::BasisSet::build` static method. It can be followed when building object factories in oep-dev too.

Chapter 9

Advanced Usage

This section is addressed for advanced users.

Make sure you have first read the introduction before proceeding.

9.1 Installation

9.1.1 Preparing Psi4

OEPDev is a Psi4 plugin. It requires

- Psi4, at least 1.2 version (git commit `9d4a61c`). Has to be modified (see below)

- Eigen3, any newer version

Note

> Before compiling, make sure EFP is enabled in `CMakeLists.txt` (now it is not used in OEPDev but maybe in the future it would).

Recently, Psi4 introduced API visibility management. Only certain Psi4 classes and functions are *exposed* in the `core.so` library, that is further linked to Psi4 plugin shared library. Due to this reason, not all Psi4 functionalities can be directly used from outside Psi4. In order to access local API of Psi4 (also used in the OEPDev code) slight modification of Psi4 code and concomitant rebuild is necessary.

In order to expose local API used by OEPDev and hidden within Psi4 1.2, two types of small modifications are necessary:

- M1: add `PSI_API` macro after required class or function declaration in header file

- M2: add `#include "psi4/pragma.h"` line at the include section of an appropriate header file

Modification M1 is obligatory for all affected files whereas modification M2 needs to be done only in headers that do not have "psi4/pragma.h" included explicitly or implicitly. The list of Psi4 header files along with the respective changes that need to be done are listed in the table below:

Psi4 Header File	Psi4 Class	Required Changes
`libfunctional/superfunctional.h`	`Superfunctional`	M1
`libscf_solver/hf.h`	`HF`	M1
`libscf_solver/rhf.h`	`RHF`	M1
`libcubeprop/csg.h`	`CubicScalarGrid`	M1
`libmints/onebody.h`	`OneBodyAOInt`	M1
`libmints/potential.h`	`PotentialInt`	M1
`libmints/multipoles.h`	`MultipoleInt`	M1
`libmints/multipolesymmetry.h`	`MultipoleSymmetry`	M1
`libmints/fjt.h`	`Taylor_Fjt`	M1
`libmints/fjt.h`	`Fjt`	M1
`libmints/oeprop.h`	`OEProp`	M1, M2
`libmints/gshell.h`	`GaussianShell`	M1, M2

To quickly apply these modifications, use the patch files stored in `misc/patch` directory. Please makse sure to use a proper patch for a chosen Psi4 version.

9.1.2 Compiltation

After all the above changes have been done in Psi4 (followed by its rebuild) compile the OEPDev code by running `compile` script. Make sure Eigen3 path is set to environment variable `EIGEN3_INCLUDE_DIR` (instructions will appear on the screen). After compilation is successful, run `ctest` to check if the code works fine.

Note

> It may happen, that during code development there will be symbol lookup error when importing `oepdev.so` (in such case OEPDev compiles without error but Python cannot import the module `oepdev`). In such circumstance, probably there some local Psi4 feature that is needed in OEPDev is not exposed by `PSI_API` macro. To fix this, run `c++filt [name]` where `[name]` is the mangled undefined symbol. This will show you which Psi4 class or function is not exposed and requires `PSI_API` (change M1 and perhaps M2 too). Such change requires Psi4 rebuild and recompilation of OEPDev code. In any case, please contact me and report new undefined symbol (blasiak.bartosz@gmail.com).

9.2 OEPDev Code Structure

As a plugin to Psi4, OEPDev consists of the main.cc file with the plugin main routine, include/oepdev_options.h specifying the options of the plugin, include/oepdev_files.h defining all global macros and environmental variables, as well as the `oepdev` directory. The latter contains the actual OEPDev code that is divided into several subdirectories called modules.

9.2.1 Main Routine

Before the actual OEPDev calculations are started, the wavefunction of the input molecular aggregate is computed by Psi4. See the plugin driver script `pymodule.py` for more details on how the calculation environment is initialized. Subsequently, one out of four types of target operations can be performed by the program:

1. `OEP_BUILD` - Compute the OEP effective parameters for one molecule.

2. `DMATPOL` - Compute the generalized density matrix susceptibility tensors (DMS's) for one molecule.

3. `SOLVER` - Perform calculations for a molecular aggregate. As for now, only dimers are handled.

4. `TEST` - Perform the testing routine.

The first two modes are single molecule calculations. `OEP_BUILD` uses the `oepdev::OEPotential::bui` static factory to create OEP objects whereas `DMATPOL` uses the `oepdev::GenEffParFactory::build` static factory to greate generalized effective fragment parameters (GEFP's) for polarization.

Note

> In the future, `OEP_BUILD` will be handled also by `oepdev::GenEffParFactory::build` since OEP parameters are part of the GEFP's.

`SOLVER` requires at least molecular dimer and the `oepdev::WavefunctionUnion` object (being the Hartree product of the unperturbed monomer wavefunctions) is constructed at the beginning, which is then passed to the `oepdev::OEPDevSolver::build` static factory. `TEST` can refer to single- or multiple-molecule calculations, whereby each of the testing routines is listed in the `cmake/CTestTestfile.cmake.in` file.

9.2.2 Modules

The source code is distributed into directories called modules:

- `liboep`

- `libgefp`

- `libsolver`

- `libints`

- `libpsi`

- `lib3d`

- `libutil`

- `libtest`

See Modules for a detailed description of each of the modules.

9.3 OEPDev Classes: Overview

9.3.1 OEP Module

The OEP module located in `oepdev/liboep` consists of the following abstract bases:

- `oepdev::OEPotential` implementing the OEP,

- `oepdev::GeneralizedDensityFit` implementing the GDF technique.

Each of the bases contains static factory method called `build` that creates instances of chosen subclasses. The module contains also a structure `oepdev::OEPType` which is a container storing all the data associated with a particular OEP: type name, dimensions, OEP coefficients and whether is density-fitted or not.

9.3.1.1 OEPPotential

It is a container and computer class of OEP. Among others, the most important public method is `oepdev::OEPotential::compute` which computes all the OEP's (by iterating over all possible OEP types within a chosen OEP subclass or category). OEP's can be extracted by `oepdev::OEPotential::oep` method, for instance. From protected attributes, each OE-Potential instance stores blocks of the LCAO-MO matrices associated with the occupied (`cOcc_`) and virtual (`cVir_`) MO's. It also contains the pointers to the primary, auxiliary and intermediate basis sets (`primary_`, `auxiliary_` and `intermediate_`, accordingly). Usage example:

```
#include "oepdev/liboep/oep.h"
oep = oepdev::OEPotential::build("ELECTROSTATIC ENERGY", wfn, options);
oep->compute();
oep->write_cube("V", "oep_cube_file");
```

So far, four OEPotential subclasses are implemented, from which `oepdev::ElectrostaticEnergyOEPo` and `oepdev::RepulsionEnergyOEPotential` are fully operative, while the rest is under development.

9.3.1.2 GeneralizedDensityFit

9.3.2 GEFP Module

9.3.2.1 GenEffPar

9.3.2.2 GenEffParFactory

9.3.2.3 GenEffFrag

9.3.3 OEPDev Solver Module

9.3.3.1 OEPDevSolver

9.4   Developing OEP's

OEP's are implemented in a suitable subclass of the oepdev::OEPotential base. Due to
the fact that OEP's can be density-based or ESP-based, the classes oepdev::GeneralizedDensityFit
as well as oepdev::ESPSolver are usually necessary in the implementations. Handling
the one-electron integrals (OEI's) and the two-electron integrals (ERI's) in AO basis is imple-
mented in oepdev::IntegralFactory. In particular, potential integrals evaluated at
arbitrary centres can be accessed by using the oepdev::PotentialInt instances. Use-
ful iterators for looping over AO ERI's the oepdev::ShellCombinationsIterator
and oepdev::AOIntegralsIterator classes. Transformations of OEI's to MO ba-
sis can be easily achieved by transforming AO integral matrices by cOcc_ and cVir_
members of OEPotential instances, e.g., by using the psi::Matrix::doublet or
psi::Matrix::triplet static methods. Transformations of ERI's to MO basis can be
performed by using the psi4/libtrans/integraltransform.h library.

It is recommended that the implementation of all the new OEP's follows the following steps:

1. **Write the class framework.** This includes choosing a proper name of a OEPotential
   subclass, sketching the constructors and a destructor, and all the necessary methods.

2. **Implement OEP types.** Each type of OEP is implemented, including the 3D vector field
   in case ESP-based OEP's are of use.

3. **Update base factory method**. Add appropriate entries in the oepdev::OEPotential::build
   static factory method.

Below, we shall go through each of these steps separately and discuss them in detail.

9.4.1   Drafting an OEP Subclass

This stage is the design of the overall framework of OEP subclass. The name should end
with OEPotential to maintain the convention used so far. The template for the header file
definition can be depicted as follows:

```cpp
class SampleOEPotential : public OEPotential
{
  public:
    // Purely ESP-based OEP's
    SampleOEPotential(SharedWavefunction wfn, Options& options);

    // GDF-based OEP's
    SampleOEPotential(SharedWavefunction wfn, SharedBasisSet auxiliary, SharedBasisSet intermediate,
      Options& options);

    // Necessary destructor
    virtual ~SampleOEPotential();

    // Necessary computer
    virtual void compute(const std::string& oepType) override;

    // Necessary computer
    virtual void compute_3D(const std::string& oepType,
                      const double& x, const double& y, const double& z, std::shared_ptr<psi::Vector>
      & v) override;
    // Necessary printer
```

```cpp
    virtual void print_header() const override;

  private:
    // Set defaults - good practice
    void common_init();

    // Auxilary computers - exemplary
    double compute_3D_sample_V(const double& x, const double& y, const double& z);
};
```

The constructors need to call the abstract base constructor and then specialized initializations. It is a good practice to put the specialized common initializers in a separate private method `common_init` (which is a convention in Psi4 and is adopted also in OEPDev). For instance, the exemplary constructor is show below:

```cpp
SampleOEPotential::SampleOEPotential(SharedWavefunction wfn,
                                     SharedBasisSet auxiliary, SharedBasisSet intermediate, Options&
    options)
 : OEPotential(wfn, auxiliary, intermediate, options)
{
    common_init();
}

void SampleOEPotential::common_init()
{
    int n1 = wfn_->Ca_subset("AO","OCC")->ncol();
    int n2 = auxiliary_->nbf();
    int n3 = wfn_->molecule()->natom();

    SharedMatrix mat_1 = std::make_shared<psi::Matrix>("G(S^{-1})", n2, n1);
    SharedMatrix mat_2 = std::make_shared<psi::Matrix>("G(S^{-2})", n3, n1);

    OEPType type_1 = {"Murrell-etal.S1", true , n1, mat_1};
    OEPType type_2 = {"Otto-Ladik.S2"  , false, n1, mat_2};

    oepTypes_[type_1.name] = type_1;
    oepTypes_[type_2.name] = type_2;
}
```

Note that the `oepdev::OEPotential::oepTypes_` attribute, which is a `std::map` of structures `oepdev::OEPType`, is initialized here. All the OEP types need to be stated in the constructors. Destructors usually call nothing, unless dynamically allocated memory is also of use.

It is also a good practice to already sketch the `compute` method here by adding certain private computers, like in the example below:

```cpp
void SampleOEPotential::compute(const std::string& oepType)
{
  if      (oepType == "Murrell-etal.S1") this->compute_murrell_etal_s1();  // calls private method
  else if (oepType ==   "Otto-Ladik.S2") this->compute_otto_ladik_s2();    // calls private method
  else throw psi::PSIEXCEPTION("OEPDEV: Error. Incorrect OEP type specified!\n"); // for safety
}
void SampleOEPotential::compute_murrell_etal_s1()
{
   psi::timer_on ("OEP    E(Paul) Murrell-etal S1  ");
   /* Your implementation goes here */
   psi::timer_off("OEP    E(Paul) Murrell-etal S1  ");
}
```

9.4.1.1 Implementing OEP Types

Implementation of the inner body of `compute` method requires populating the members of `oepTypes_` with data. This means, that for each OEP type there has to be a specific implementation of OEP parameters. GDF-based OEP's need to create the `psi::Matrix` with OEP

parameters and put them into `oepTypes_`. In the case of ESP-based OEP's `compute_3D` method has to be additionally implemented before `compute` is fully functional. To implement `compute_3D`, `oepdev::OEPotential::make_oeps3d` method is of high relevance: it creates `oepdev::OEPotential3D<T>` instances, where `T` is the OEP subclass. These instances are `oepdev::Field3D` objects that define OEP's in 3D Euclidean space. For example,

```
void SampleOEPotential::compute_otto_ladik_s2()
{
    // Switch on timer
    psi::timer_on("OEP    E(Paul) Otto-Ladik S2    ");

    // Create 3D field, automated through 'make_oeps3d'. Requires 'compute_3D' implementation.
    std::shared_ptr<OEPotential3D<OEPotential>> oeps3d = this->make_oeps3d("Otto-Ladik.S2");
    oeps3d->compute();

    // Perform ESP fit to get OEP effective charges
    ESPSolver esp(oeps3d);
    esp.set_charge_sums(0.5);
    esp.compute();

    // Put the OEP coefficients into 'oepTypes_'
    for (int i=0; i<esp.charges()->nrow(); ++i) {
        for (int o=0; o<oepTypes_["Otto-Ladik.S2"].n; ++o) {
            oepTypes_["Otto-Ladik.S2"].matrix->set(i, o, esp.charges()->get(i, o));
        }
    }

    // Switch off timer
    psi::timer_off("OEP    E(Paul) Otto-Ladik S2    ");
}
// Necessary implementation for 'make_oeps3d' to work
void SampleOEPotential::compute_3D(const std::string& oepType, const double& x, const double& y, const
    double& z, std::shared_ptr<psi::Vector>& v)
{
    // Loop over all possibilities for OEP types and exclude illegal names
    if (oepType == "Otto-Ladik.S2") {

        // this computes the actual values of OEP = v(x,y,z) and stores it in 'vec_otto_ladik_s2_'
        this->compute_3D_otto_ladik_s2(x, y, z);

        // Assign final value to the buffer vector
        for (int o = 0; o < oepTypes_["Otto-Ladik.S2"].n; ++o) v->set(o, vec_otto_ladik_s2_[o]);

    }
    else if (oepType == "Murrell-etal.S1" ) {/* Even if it is not ESP-based OEP, this line is necessary */}

    else {
        throw psi::PSIEXCEPTION("OEPDEV: Error. Incorrect OEP type specified!\n"); // Safety
    }
}
```

Note that `make_oeps3d` is not overridable and is fully defined in the base. Do not call `oepdev::OEPotential3D` constructors in the OEPotential subclass (it can be done only from the level of the abstract base where all the pointers are dynamically converted to an appropriate data type due to polymorphism)!

9.4.1.2 Abstract Base

Chapter 10

Copyright © 2012, Bartosz Błasiak (blasiak.bartosz@gmail.com)

to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

1. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

```
a) The modified work must itself be a software library.

b) You must cause the files modified to carry prominent notices
stating that you changed the files and the date of any change.

c) You must cause the whole of the work to be licensed at no
charge to all third parties under the terms of this License.

d) If a facility in the modified Library refers to a function or a
table of data to be supplied by an application program that uses
the facility, other than as an argument passed when the facility
is invoked, then you must make a good faith effort to ensure that,
in the event an application does not supply such function or
table, the facility still operates, and performs whatever part of
```

```
    its purpose remains meaningful.

    (For example, a function in a library to compute square roots has
    a purpose that is entirely well-defined independent of the
    application.  Therefore, Subsection 2d requires that any
    application-supplied function or table used by this function must
    be optional: if the application does not supply it, the square
    root function must still compute square roots.)
```

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

1. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

   Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

1. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

1. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

1. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

```
a) Accompany the work with the complete corresponding
machine-readable source code for the Library including whatever
changes were used in the work (which must be distributed under
Sections 1 and 2 above); and, if the work is an executable linked
with the Library, with the complete machine-readable "work that
uses the Library", as object code and/or source code, so that the
user can modify the Library and then relink to produce a modified
executable containing the modified Library.  (It is understood
that the user who changes the contents of definitions files in the
Library will not necessarily be able to recompile the application
to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the
Library.  A suitable mechanism is one that (1) uses at run time a
copy of the library already present on the user's computer system,
rather than copying library functions into the executable, and (2)
will operate properly with a modified version of the library, if
```

```
the user installs one, as long as the modified version is
interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at
least three years, to give the same user the materials
specified in Subsection 6a, above, for a charge no more
than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy
from a designated place, offer equivalent access to copy the above
specified materials from the same place.

e) Verify that the user has already received a copy of these
materials or that you have already sent this user a copy.
```

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

1. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

   ```
   a) Accompany the combined library with a copy of the same work
   based on the Library, uncombined with any other library
   facilities.  This must be distributed under the terms of the
   Sections above.

   b) Give prominent notice with the combined library of the fact
   that part of it is a work based on the Library, and explaining
   where to find the accompanying uncombined form of the same work.
   ```

2. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

3. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

4. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

5. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

1. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

2. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

1. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software

Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

2. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

3. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year>  <name of author>

This library is free software; you can redistribute it and/or
modify it under the terms of the GNU Lesser General Public
License as published by the Free Software Foundation; either
version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE.  See the GNU
Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public
License along with this library; if not, write to the Free Software
Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA  02110-1301  USA
```

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library 'Frob' (a library for tweaking knobs) written by James Random Hacker.

16.1   The Generalized One-Electron Potentials Library

Implements the goal of this project: The Generalized One-Electron Potentials (OEP's). You
will find here OEP's for computation of Pauli repulsion energy, charge-transfer energy and oth-
ers. The routines for the generalized density fitting are also implemented here. Located at
`oepdev/liboep`.

Classes

- struct oepdev::OEPType

    Container to handle the type of One-Electron Potentials.

- class oepdev::OEPotential

    Generalized One-Electron Potential: Abstract base.

- class oepdev::ElectrostaticEnergyOEPotential

    Generalized One-Electron Potential for Electrostatic Energy.

- class oepdev::RepulsionEnergyOEPotential

    Generalized One-Electron Potential for Pauli Repulsion Energy.

- class oepdev::ChargeTransferEnergyOEPotential

    Generalized One-Electron Potential for Charge-Transfer Interaction Energy.

- class oepdev::EETCouplingOEPotential

    Generalized One-Electron Potential for EET coupling calculations.

- class oepdev::GeneralizedDensityFit

    Generalized Density Fitting Scheme. Abstract Base.

- class oepdev::SingleGeneralizedDensityFit

    Generalized Density Fitting Scheme - Single Fit.

- class oepdev::DoubleGeneralizedDensityFit

    Generalized Density Fitting Scheme - Double Fit.

- class oepdev::OverlapGeneralizedDensityFit

    Generalized Density Fitting Scheme - Single Fit Based on Minimal Overlap in MO Basis.

Typedefs

- using **oepdev::SharedOEPotential** = std::shared_ptr< OEPotential >

16.1.1   Detailed Description

16.2 The OEPDev Solver Library

Implementations of various solvers for molecular properties as a functions of unperturbed monomeric wavefunctions. This is the place all target OEP-based models are implemented and compared with benchmark and competitor models. Located at `oepdev/libsolver`.

Classes

- class oepdev::OEPDevSolver

  Solver of properties of molecular aggregates. Abstract base.

- class oepdev::ElectrostaticEnergySolver

  Compute the Coulombic interaction energy between unperturbed wavefunctions.

- class oepdev::RepulsionEnergySolver

  Compute the Pauli-Repulsion interaction energy between unperturbed wavefunctions.

- class oepdev::ChargeTransferEnergySolver

  Compute the Charge-Transfer interaction energy between unperturbed wavefunctions.

- class oepdev::EETCouplingSolver

  Compute the EET coupling energy between unperturbed wavefunctions.

- class oepdev::TIData

  Transfer Integral EET Data.

16.2.1 Detailed Description

16.3 The Generalized Effective Fragment Potentials Library

Implements the GEFP method, the far goal of the OEPDev project. Here you will find the containers for GEFP parameters, the density matrix susceptibility tensors and GEFP solvers. Located at `oepdev/libgefp`.

Classes

- class oepdev::GenEffPar

  Generalized Effective Fragment Parameters. Container Class.

- class oepdev::GenEffFrag

  Generalized Effective Fragment. Container Class.

- class oepdev::GenEffParFactory

  Generalized Effective Fragment Factory. Abstract Base.

- class oepdev::EFP2_GEFactory

  EFP2 GEFP Factory.

- class oepdev::OEP_EFP2_GEFactory

  OEP-EFP2 GEFP Factory.

- class oepdev::PolarGEFactory

  Polarization GEFP Factory. Abstract Base.

- class oepdev::AbInitioPolarGEFactory

  Polarization GEFP Factory from First Principles. Hartree-Fock Approximation.

- class oepdev::FFAbInitioPolarGEFactory

  Polarization GEFP Factory from First Principles: Finite-Difference Model. Arbitrary level of theory.

- class oepdev::GeneralizedPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::UniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::NonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::LinearUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::QuadraticUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::LinearNonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::QuadraticNonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::LinearGradientNonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::QuadraticGradientNonUniformEFieldPolarGEFactory

    Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::UnitaryTransformedMOPolarGEFactory

    Polarization GEFP Factory with Least-Squares Scaling of MO Space.

- class oepdev::FragmentedSystem

    Molecular System for Fragment-Based Calculations.

Typedefs

- using oepdev::SharedGenEffPar = std::shared_ptr< GenEffPar >

    GEFP Parameters container.

- using oepdev::SharedGenEffParFactory = std::shared_ptr< GenEffParFactory >

    GEFP Parameter factory.

- using oepdev::SharedGenEffFrag = std::shared_ptr< GenEffFrag >

    GEFP Fragment container.

- using oepdev::SharedFragmentedSystem = std::shared_ptr< FragmentedSystem >

    Fragmented system.

16.3.1 Detailed Description

The objective is to implement the framework for the fragment-based (FB) calculations in which the system is divided into interacting fragments. The functionality relies on a few data structures:

- the `GenEffFrag` - Generalized Effective Fragment

- the `GenEffPar` - Generalized Effective Parameters

- the `GenEffParFactory` - Generalized Effective Parameters Factory Fragments can contain multiple types of parameters, e.g., ethylene fragment can have EFP2, OEP-EFP2 as well as OEP-EET parameters. Fragments can be superimposed on target structures and the class contain methods that evaluate properties based on the fragments in the system.

16.4 The Integral Package Library

Implementations of various two-, three- or four-centre two-body electron repulsion integrals via utilizing the McMurchie-Davidson recurrence scheme. Located at `oepdev/libints` and `oepdev/libpsi`.

Classes

- class oepdev::TwoElectronInt

  General Two Electron Integral.

- class oepdev::ERI_1_1

  2-centre ERI of the form (a|O(2)|b) where O(2) = 1/r12.

- class oepdev::ERI_2_2

  4-centre ERI of the form (ab|O(2)|cd) where O(2) = 1/r12.

- class oepdev::ERI_3_1

  4-centre ERI of the form (abc|O(2)|d) where O(2) = 1/r12.

- class oepdev::EFPMultipolePotentialInt

  Computes potential integrals.

- class oepdev::TwoBodyAOInt

- class oepdev::IntegralFactory

  Extended IntegralFactory for computing integrals.

- class oepdev::ObaraSaikaTwoCenterEFPRecursion_New

  Obara-Saika recursion formulae for improved EFP multipole potential integrals.

- class oepdev::PotentialInt

  Computes potential integrals.

Macros

- #define D1_INDEX(x, i, n) ((81∗(x))+(9∗(i))+(n))

  Get the index of McMurchie-Davidson-Hermite D1 coefficient stored in the `mdh_buffer_`, that is attributed to the x Cartesian coordinate from angular momentum i of function 1, and the Hermite index n.

- #define D2_INDEX(x, i, j, n) ((1377∗(x))+(153∗(i))+(17∗(j))+(n))

  Get the index of McMurchie-Davidson-Hermite D2 coefficient stored in the `mdh_buffer_`, that is attributed to the x Cartesian coordinate from angular momenta i, j of function 1 and 2, and the Hermite index n.

- #define D3_INDEX(x, i, j, k, n) ((18225∗(x))+(2025∗(i))+(225∗(j))+(25∗(k))+(n))

  Get the index of McMurchie-Davidson-Hermite D3 coefficient stored in the `mdh_buffer_`, that is attributed to the x Cartesian coordinate from angular momenta i, j and k of function 1, 2 and 3, and the Hermite index n.

- #define R_INDEX(n, l, m, j) ((14739∗(n))+(867∗(l))+(51∗(m))+(j))

  Get the index of McMurchie-Davidson R coefficient stored in the `mdh_buffer_R_` from angular momenta n, l and m and the Boys index j.

Functions

- double oepdev::d_N_n1_n2 (int N, int n1, int n2, double PA, double PB, double aP)

    Compute McMurchie-Davidson-Hermite (MDH) coefficient for binomial expansion.

- void oepdev::make_mdh_D1_coeff (int n1, double aPd, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for monomial expansion.

- void oepdev::make_mdh_D2_coeff (int n1, int n2, double aPd, double ∗PA, double ∗PB, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for binomial expansion.

- void oepdev::make_mdh_D3_coeff (int n1, int n2, int n3, double aPd, double ∗PA, double ∗PB, double ∗PC, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for trinomial expansion.

- void oepdev::make_mdh_D2_coeff_explicit_recursion (int n1, int n2, double aP, double ∗PA, double ∗PB, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for binomial expansion by explicit recursion. This function makes the same changes to buffers as oepdev::make_mdh_D2_coeff, but implements it through explicit recursion by calls to oepdev::d_N_n1_n2. Therefore, it is slightly slower. Here for debugging purposes.

- void oepdev::make_mdh_R_coeff (int N, int L, int M, double alpha, double a, double b, double c, double ∗F, double ∗buffer)

    Compute the McMurchie-Davidson R coefficients.

16.4.1 Detailed Description

Here, we define the primitive Gaussian type functions (GTO's)

$$\phi_i(\mathbf{r}) \equiv x_A^{n_1} y_A^{l_1} z_A^{m_1} e^{-\alpha_1 r_A^2}$$

$$\phi_j(\mathbf{r}) \equiv x_B^{n_2} y_B^{l_2} z_B^{m_2} e^{-\alpha_2 r_B^2}$$

$$\phi_k(\mathbf{r}) \equiv x_C^{n_3} y_C^{l_3} z_C^{m_3} e^{-\alpha_3 r_C^2}$$

in which $\mathbf{r}_A \equiv \mathbf{r} - \mathbf{A}$ and so on. $\mathbf{A}$ is the centre of the GTO, α_1 its exponent, whereas n_1, l_1, m_1 the Cartesian angular momenta, with the total angular momentum $\theta_1 = n_1 + l_1 + m_1$.

In OEPDev implementations, the following definition shall be in use:

$$\mathbf{P} \equiv \frac{\alpha_1 \mathbf{A} + \alpha_2 \mathbf{B}}{\alpha_1 + \alpha_2}$$

$$\mathbf{Q} \equiv \frac{\alpha_3 \mathbf{C} + \alpha_4 \mathbf{D}}{\alpha_3 + \alpha_4}$$

$$\mathbf{R} \equiv \frac{\alpha_1 \mathbf{A} + \alpha_2 \mathbf{B} + \alpha_3 \mathbf{C}}{\alpha_1 + \alpha_2 + \alpha_3}$$

$$\alpha_P \equiv \alpha_1 + \alpha_2$$

$$\alpha_Q \equiv \alpha_3 + \alpha_4$$

$$\alpha_R \equiv \alpha_1 + \alpha_2 + \alpha_3$$

The unnormalized products of primitive GTO's are denoted here as

$$[ij] \equiv \phi_i(\mathbf{r})\phi_j(\mathbf{r})$$
$$[ijk] \equiv \phi_i(\mathbf{r})\phi_j(\mathbf{r})\phi_k(\mathbf{r})$$

16.4.2 Hermite Operators

It is convenient to define

$$\Lambda_j(x_P;\alpha_P) \equiv \left(\frac{\partial}{\partial P_x}\right)^j = \alpha_P^{j/2}H_j(\sqrt{\alpha_P}x_P)$$

where $H_j(x)$ is the Hermite polynomial of order j evaluated at x. Introduction of the above Hermite operator can be used by invoking the recurrence relationship due to Hermite polynomial properties:

$$x_A\Lambda_j(x_P;\alpha_P) = j\Lambda_{j-1} + |\mathbf{P}-\mathbf{A}|_x\Lambda_j + \frac{1}{2\alpha_P}\Lambda_{j+1}$$

This can be directly used to derive very useful McMurchie-Davidson-Hermite coefficients as expansion coefficients of the polynomial expansions.

16.4.2.1 Polynomial Expansions as Hermite Series

By using the previous relation, it is possible to express the following expansions in Hermite series:

$$x_A^{n_1} = \sum_{N=0}^{n_1} d_N^{n_1}\Lambda_N(x_A;\alpha_A)$$
$$x_A^{n_1}x_B^{n_2} = \sum_{N=0}^{n_1+n_2} d_N^{n_1n_2}\Lambda_N(x_P;\alpha_P)$$
$$x_A^{n_1}x_B^{n_2}x_C^{n_3} = \sum_{N=0}^{n_1+n_2+n_3} d_N^{n_1n_2n_3}\Lambda_N(x_R;\alpha_R)$$

The recurrence relationships can be easily found and they read

$$d_N^{n_1+1} = \frac{1}{2\alpha_A}d_{N-1}^{n_1} + (N+1)d_{N+1}^{n_1}$$

as well as

$$d_N^{n_1+1,n_2} = \frac{1}{2\alpha_P}d_{N-1}^{n_1n_2} + |\mathbf{P}-\mathbf{A}|_x d_N^{n_1n_2} + (N+1)d_{N+1}^{n_1n_2}$$
$$d_N^{n_1,n_2+1} = \frac{1}{2\alpha_P}d_{N-1}^{n_1n_2} + |\mathbf{P}-\mathbf{B}|_x d_N^{n_1n_2} + (N+1)d_{N+1}^{n_1n_2}$$

and

$$d_N^{n_1+1,n_2,n_3} = \frac{1}{2\alpha_R}d_{N-1}^{n_1n_2n_3} + |\mathbf{R}-\mathbf{A}|_x d_N^{n_1n_2n_3} + (N+1)d_{N+1}^{n_1n_2n_3}$$

$$d_N^{n_1,n_2+1,n_3} = \frac{1}{2\alpha_R}d_{N-1}^{n_1n_2n_3} + |\mathbf{R}-\mathbf{B}|_x d_N^{n_1n_2n_3} + (N+1)d_{N+1}^{n_1n_2n_3}$$

$$d_N^{n_1,n_2,n_3+1} = \frac{1}{2\alpha_R}d_{N-1}^{n_1n_2n_3} + |\mathbf{R}-\mathbf{C}|_x d_N^{n_1n_2n_3} + (N+1)d_{N+1}^{n_1n_2n_3}$$

respectively. The first elements are given by

$$d_0^0 = 1$$
$$d_0^{00} = 1$$
$$d_0^{000} = 1$$

By using the above formalisms, it is strightforward to express the doublet of primitive GTO's as

$$[ij] = E_{ij} \sum_{N=0}^{n_1+n_2} \sum_{L=0}^{l_1+l_2} \sum_{M=0}^{m_1+m_2} d_N^{n_1n_2} d_L^{l_1l_2} d_M^{m_1m_2} \Lambda_N(x_P)\Lambda_L(y_P)\Lambda_M(z_P)e^{-\alpha_P r_P^2}$$

Analogously, the triplet of primitive GTO's is given by

$$[ijk] = E_{ijk} \sum_{N=0}^{n_1+n_2+n_3} \sum_{L=0}^{l_1+l_2+l+3} \sum_{M=0}^{m_1+m_2+m_3} d_N^{n_1n_2n_3} d_L^{l_1l_2l_3} d_M^{m_1m_2m_3} \Lambda_N(x_R)\Lambda_L(y_R)\Lambda_M(z_R)e^{-\alpha_R r_R^2}$$

The multiplicative constants are given by

$$E_{ij}(\alpha_1,\alpha_2) = \exp\left[-\frac{\alpha_1\alpha_2}{\alpha_1+\alpha_2}|\mathbf{A}-\mathbf{B}|^2\right]$$

$$E_{ijk}(\alpha_1,\alpha_2,\alpha_3) = \exp\left[-\frac{\alpha_1\alpha_2}{\alpha_1+\alpha_2}|\mathbf{A}-\mathbf{B}|^2\right]\exp\left[-\frac{(\alpha_1+\alpha_2)\alpha_3}{\alpha_1+\alpha_2+\alpha_3}|\mathbf{P}-\mathbf{C}|^2\right]$$

16.4.3 One-Body Integrals over Hermite Functions

The fundamental Hermite integrals that appear during computations of any kind of one-body integrals over GTO's are as follows

$$[NLM|\Theta(1)] \equiv \int d\mathbf{r}_1 \Theta(\mathbf{r}_1)\Lambda_N(x_{1P};\alpha_P)\Lambda_L(y_{1P};\alpha_P)\Lambda_M(z_{1P};\alpha_P)e^{-\alpha_P r_{1P}^2}$$

It immediately follows that the overlap, dipole, quadrupole and potential integrals are given as

$$[NLM|1] = \delta_{N0}\delta_{L0}\delta_{M0}\left(\frac{\pi}{\alpha_P}\right)^{3/2}$$

$$[NLM|x_C] = [\delta_{N1} + |\mathbf{PC}|_x \delta_{N0}]\,\delta_{L0}\delta_{M0}\left(\frac{\pi}{\alpha_P}\right)^{3/2}$$

$$[NLM|x_C^2] = \left[2\delta_{N2} + 2|\mathbf{PC}|_x\delta_{N1} + \left(|\mathbf{PC}|_x^2 + \frac{1}{2\alpha_P}\right)\delta_{N0}\right]\delta_{L0}\delta_{M0}\left(\frac{\pi}{\alpha_P}\right)^{3/2}$$

$$[NLM|x_Cy_C] = (\delta_{N1} + |\mathbf{PC}|_x\delta_{N0})(\delta_{L1} + |\mathbf{PC}|_y\delta_{L0})\delta_{M0}\left(\frac{\pi}{\alpha_P}\right)^{3/2}$$

$$[NLM|r_C^{-1}] = \frac{2\pi}{\alpha_P}R_{NLM}$$

The coefficients R_{NLM} are discussed in separate section below.

16.4.4 Two-Body Integrals over Hermite Functions

The fundamental Hermite integrals that appear during computations of any kind of two-electron integrals over GTO's are as follows

$$[N_1 L_2 M_2 | N_2 L_2 M_2] \equiv \iint d\mathbf{r}_1 d\mathbf{r}_2 \Lambda_{N_1}(x_{1P}; \alpha_P) \Lambda_{L_1}(y_{1P}; \alpha_P) \Lambda_{M_1}(z_{1P}; \alpha_P) \Lambda_{N_2}(x_{2Q}; \alpha_Q) \Lambda_{L_2}(y_{2Q}; \alpha_Q) \Lambda_{M_2}(z_{2Q}; \alpha_Q)$$

The above formula dramatically reduces to the following

$$[N_1 L_2 M_2 | N_2 L_2 M_2] = \lambda (-)^{N2+L2+M2} R_{N1+N2, L1+L2, M1+M2}$$

with

$$\lambda \equiv \frac{2\pi^{5/2}}{\alpha_P \alpha_Q \sqrt{\alpha_P + \alpha_Q}}$$

To compute the $R_{N1+N2, L1+L2, M1+M2}$ coefficients, the parameter T is given by

$$T = \frac{\alpha_P \alpha_Q}{\alpha_P + \alpha_Q} |\mathbf{P} - \mathbf{Q}|^2$$

16.4.5 The R(N,L,M) Coefficients

The R coefficients are defined as

$$R_{NLM} \equiv \left(\frac{\partial}{\partial a}\right)^N \left(\frac{\partial}{\partial b}\right)^L \left(\frac{\partial}{\partial c}\right)^M \int_0^1 e^{-Tu^2} \, du$$

with

$$T \equiv \alpha \left(a^2 + b^2 + c^2\right)$$

By extending the above definition to more general

$$R_{NLMj} \equiv \left(-\sqrt{\alpha}\right)^{N+L+M} (-2\alpha)^j \int_0^1 u^{N+L+M+2j} H_N(au\sqrt{\alpha}) H_L(bu\sqrt{\alpha}) H_M(cu\sqrt{\alpha}) e^{-Tu^2} \, du$$

one can see that

$$R_{000j} = (-2\alpha)^j F_j(T)$$

The Boys function is here given by

$$F_j(T) \equiv \int_0^1 u^{2j} e^{-Tu^2} \, du$$

and its efficient implementation can be discussed elsewhere. In Psi4, `psi::Taylor_Fjt` class is used for this purpose.

Now, it is possible to show that the following recursion relationships are true:

$$R_{0,0,M+1,j} = cR_{0,0,M,j+1} + MR_{0,0,M-1,j+1}$$
$$R_{0,L+1,M,j} = bR_{0,L,M,j+1} + LR_{0,L-1,M,j+1}$$
$$R_{N+1,L,M,j} = aR_{N,L,M,j+1} + NR_{N-1,L,M,j+1}$$

This scheme is implemented in OEPDev.

16.4.6 Function Documentation

16.4.6.1 d_N_n1_n2()

```
double oepdev::d_N_n1_n2 (
          int N,
          int n1,
          int n2,
          double PA,
          double PB,
          double aP )
```

Parameters

N	- increment in the summation of MDH series
n1	- angular momentum of first function
n2	- angular momentum of second function
PA	- cartesian component of P-A distance
PB	- cartesian component of P-B distance
aP	- free parameter of MDH expansion

Returns

the McMurchie-Davidson-Hermite coefficient

16.4.6.2 make_mdh_D1_coeff()

```
void oepdev::make_mdh_D1_coeff (
          int n1,
          double aPd,
          double * buffer )
```

Parameters

n1	- angular momentum of first function
aPd	- parameter equal to 0.500/Pa where Pa is exponent
buffer	- the McMurchie-Davidson-Hermite 3-dimensional array (raveled to vector): • axis 0: dimension 3 (x, y or z Cartesian component) • axis 1: dimension n1+1 (0 to n1) • axis 2: dimension n1+1 (0 to n1)

See also

> [D1 INDEX](#)

16.4.6.3 make_mdh_D2_coeff()

```
void oepdev::make_mdh_D2_coeff (
        int n1,
        int n2,
        double aPd,
        double * PA,
        double * PB,
        double * buffer )
```

Parameters

n1	- angular momentum of first function
n2	- angular momentum of second function
aPd	- parameter equal to 0.500/Pa where Pa is exponent
PA	- cartesian components of P-A distance
PB	- cartesian components of P-B distance
buffer	- the McMurchie-Davidson-Hermite 4-dimensional array (raveled to vector): • axis 0: dimension 3 (x, y or z Cartesian component) • axis 1: dimension n1+1 (0 to n1) • axis 2: dimension n2+1 (0 to n2) • axis 3: dimension n1+n2+1 (0 to n1+n2)

See also

> [D2 INDEX](#)

16.4.6.4 make_mdh_D2_coeff_explicit_recursion()

```
void oepdev::make_mdh_D2_coeff_explicit_recursion (
        int n1,
        int n2,
        double aP,
        double * PA,
        double * PB,
        double * buffer )
```

Parameters

n1	- angular momentum of first function
n2	- angular momentum of second function
aPd	- parameter equal to 0.500/Pa where Pa is exponent
PA	- cartesian components of P-A distance
PB	- cartesian components of P-B distance
buffer	- the McMurchie-Davidson-Hermite 4-dimensional array (raveled to vector): • axis 0: dimension 3 (x, y or z Cartesian component) • axis 1: dimension n1+1 (0 to n1) • axis 2: dimension n2+1 (0 to n2) • axis 3: dimension n1+n2+1 (0 to n1+n2)

See also

> [D2_INDEX](#)

16.4.6.5   make_mdh_D3_coeff()

```
void oepdev::make_mdh_D3_coeff (
          int n1,
          int n2,
          int n3,
          double aPd,
          double * PA,
          double * PB,
          double * PC,
          double * buffer )
```

Parameters

n1	- angular momentum of first function
n2	- angular momentum of second function
n3	- angular momentum of third function
aPd	- parameter equal to 0.500/Pa where Pa is exponent
PA	- cartesian components of P-A distance
PB	- cartesian components of P-B distance
PC	- cartesian components of P-C distance

Parameters

buffer	- the McMurchie-Davidson-Hermite 5-dimensional array (raveled to vector): • axis 0: dimension 3 (x, y or z Cartesian component) • axis 1: dimension n1+1 (0 to n1) • axis 2: dimension n2+1 (0 to n2) • axis 3: dimension n3+1 (0 to n3) • axis 4: dimension n1+n2+n3+1 (0 to n1+n2+n3)

See also

> [D3_INDEX](#)

16.4.6.6 make_mdh_R_coeff()

```
void oepdev::make_mdh_R_coeff (
            int N,
            int L,
            int M,
            double alpha,
            double a,
            double b,
            double c,
            double * F,
            double * buffer )
```

Parameters

N	- increment in the summation of MDH series along *x* direction
L	- increment in the summation of MDH series along *y* direction
M	- increment in the summation of MDH series along *z* direction
alpha	- alpha parameter of R coefficient
a	- *x* component of PQ vector of R coefficient
b	- *y* component of PQ vector of R coefficient
c	- *z* component of PQ vector of R coefficient
F	- array of Boys function values for given alpha and PQ

Parameters

buffer	- the McMurchie-Davidson 4-dimensional array (raveled to vector): • axis 0: dimension N+1 • axis 1: dimension L+1 • axis 2: dimension M+1 • axis 3: dimension N+L+M+1 (j-th element)

16.5 The Three-Dimensional Vector Fields Library

Handles all sorts of scalar distributions in 3D Euclidean space, such as general vector potentials defined at particular collection of points. In this Module, you will also find handling both random and ordered points collections in a form of a G09 cube, as well as handling G09 Cube files. You will also find solvers used to fit the generalized multipole moments of a generalized density distribution, such as the electrostatic potential (ESP) fitting method. Located at `oepdev/lib3d`.

Classes

- class oepdev::MultipoleConvergence

  Multipole Convergence.

- class oepdev::DMTPole

  Distributed Multipole Analysis Container and Computer. Abstract Base.

- class oepdev::CAMM

  Cumulative Atomic Multipole Moments.

- class oepdev::ESPSolver

  Charges from Electrostatic Potential (ESP). A solver-type class.

- class oepdev::Points3DIterator

  Iterator over a collection of points in 3D space. Abstract base.

- class oepdev::CubePoints3DIterator

  Iterator over a collection of points in 3D space. g09 Cube-like order.

- class oepdev::RandomPoints3DIterator

  Iterator over a collection of points in 3D space. Random collection.

- class oepdev::PointsCollection3D

  Collection of points in 3D space. Abstract base.

- class oepdev::RandomPointsCollection3D

  Collection of random points in 3D space.

- class oepdev::CubePointsCollection3D

  G09 cube-like ordered collection of points in 3D space.

- class oepdev::Field3D

  General Vector Dield in 3D Space. Abstract base.

- class oepdev::ElectrostaticPotential3D

  Electrostatic potential of a molecule.

- class oepdev::OEPotential3D< T >

  Class template for OEP 3D fields.

Typedefs

- using oepdev::SharedDMTPole = std::shared_ptr< DMTPole >

  DMTPole object.

- using **oepdev::SharedField3D** = std::shared_ptr< oepdev::Field3D >

Functions

- oepdev::OEPotential3D< T >::OEPotential3D (const int &ndim, const int &np, const double &padding, std::shared_ptr< T > oep, const std::string &oepType)

    Construct random spherical collection of 3D field of type T.

- oepdev::OEPotential3D< T >::OEPotential3D (const int &ndim, const int &nx, const int &ny, const int &nz, const double &px, const double &py, const double &pz, std::shared_ptr< T > oep, const std::string &oepType, psi::Options &options)

    Construct ordered 3D collection of 3D field of type T.

- virtual oepdev::OEPotential3D< T >::∼OEPotential3D ()

    Destructor.

- virtual void oepdev::OEPotential3D< T >::print () const

    Print information of the object to Psi4 output.

- virtual std::shared_ptr< psi::Vector > oepdev::OEPotential3D< T >::compute_xyz (const double &x, const double &y, const double &z)

    Compute a value of 3D field at point (x, y, z)

16.5.1 Detailed Description

16.5.2 Function Documentation

16.5.2.1 OEPotential3D() [1/2]

```
template<class T >
oepdev::OEPotential3D< T >::OEPotential3D (
          const int & ndim,
          const int & np,
          const double & padding,
          std::shared_ptr< T > oep,
          const std::string & oepType )
```

The points are drawn according to uniform distrinution in 3D space.

Parameters

ndim	- dimensionality of 3D field (1: scalar field, >2: vector field)
np	- number of points to draw
padding	- spherical padding distance (au)
oep	- OEP object of type T
oepType	- type of OEP

16.5.2.2 OEPotential3D() [2/2]

```
template<class T >
oepdev::OEPotential3D< T >::OEPotential3D (
            const int & ndim,
            const int & nx,
            const int & ny,
            const int & nz,
            const double & px,
            const double & py,
            const double & pz,
            std::shared_ptr< T > oep,
            const std::string & oepType,
            psi::Options & options )
```

The points are generated according to Gaussian cube file format.

Parameters

ndim	- dimensionality of 3D field (1: scalar field, >2: vector field)
nx	- number of points along x direction
ny	- number of points along y direction
nz	- number of points along z direction
px	- padding distance along x direction
py	- padding distance along y direction
pz	- padding distance along z direction
oep	- OEP object of type T
oepType	- type of OEP
options	- Psi4 options object

16.6 The Density Functional Theory Library

Implements the OEPDev ab initio DFT methods. Located at `oepdev/libdft`. Currently, this library is empty.

16.6 The Density Functional Theory Library

16.7 The OEPDev Utilities

Contains utility functions such as printing OEPDev preambule to the output file, class for wave-function union, DIIS converger, CPHF Solver, SCF solver for external electrostatic perturbations, and others. You will also find here various iterators to go through orbital shells while computing ERI, or iterators over ERI itself. Located at `oepdev/libutil`.

Classes

- struct oepdev::CISData

    CIS wavefunction parameters. Container structure.

- class oepdev::CISComputer

    CISComputer.

- class oepdev::R_CISComputer
- class oepdev::U_CISComputer
- class oepdev::R_CISComputer_Explicit
- class oepdev::R_CISComputer_DL

    CIS Computer with RHF reference: Davidson-Liu Solver.

- class oepdev::R_CISComputer_Direct
- class oepdev::U_CISComputer_Explicit
- class oepdev::U_CISComputer_DL

    CIS Computer with UHF reference: Davidson-Liu Solver.

- class oepdev::CPHF

    CPHF solver class.

- class oepdev::DavidsonLiu

    Davidson-Liu diagonalization method.

- class oepdev::DIISManager

    DIIS manager.

- class oepdev::GramSchmidt

    Gram-Schmidt orthogonalization method.

- class oepdev::ShellCombinationsIterator

    Iterator for Shell Combinations. Abstract Base.

- class oepdev::AOIntegralsIterator

    Iterator for AO Integrals. Abstract Base.

- class oepdev::AllAOShellCombinationsIterator_4

    Loop over all possible ERI shells in a shell quartet.

- class oepdev::AllAOShellCombinationsIterator_2

    Loop over all possible ERI shells in a shell doublet.

- class oepdev::AllAOIntegralsIterator_4

    Loop over all possible ERI within a particular shell quartet.

- class oepdev::AllAOIntegralsIterator_2

Loop over all possible ERI within a particular shell doublet.

- class oepdev::KabschSuperimposer

  Compute the Cartesian rotation matrix between two structures.

- struct oepdev::QUAMBOData

  Container to store the QUAMBO data.

- class oepdev::QUAMBO

  The Quasiatomic Minimal Basis Set Molecular Orbitals (QUAMBO)

- struct oepdev::PerturbCharges

  Structure to hold perturbing charges.

- class oepdev::RHFPerturbed

  RHF theory under electrostatic perturbation.

- struct oepdev::ABCD

  Simple structure to hold the Fourier series expansion coefficients.

- struct oepdev::Fourier5

  Simple structure to hold the Fourier series expansion coefficients for N=2.

- struct oepdev::Fourier9

  Simple structure to hold the Fourier series expansion coefficients for N=4.

- class oepdev::UnitaryOptimizer

  Find the optimim unitary matrix of quadratic matrix equation.

- class oepdev::UnitaryOptimizer_4_2

  Find the optimim unitary matrix for quartic-quadratic matrix equation with trace.

- class oepdev::UnitaryOptimizer_2

  Find the optimim unitary matrix for quadratic matrix equation with trace.

- class oepdev::UnitaryOptimizer_2_1
- class oepdev::WavefunctionUnion

  Union of two Wavefunction objects.

Macros

- #define OEPDEV_USE_PSI4_DIIS_MANAGER 0

  Use DIIS from Psi4 (1) or OEPDev (0)?

- #define OEPDEV_MAX_AM 8

  L_max.

- #define OEPDEV_N_MAX_AM 17

  2L_max+1

- #define OEPDEV_CRIT_ERI 1e-9

  *ERI criterion for E12, E34, E123 and lambda*EXY coefficients.*

- #define OEPDEV_SIZE_BUFFER_R 250563

  *Size of R buffer (OEPDEV_N_MAX_AM*OEPDEV_N_MAX_AM*OEPDEV_N_MAX_AM*OEPDEV_N_MAX_AM*3)*

- #define OEPDEV_SIZE_BUFFER_D2 3264

Size of D2 buffer (3∗(OEPDEV_MAX_AM+1)∗(OEPDEV_MAX_AM+1)∗OEPDEV_N_MAX_AM)

- #define OEPDEV_AU_KcalPerMole 627.509

    Energy converters.

- #define **OEPDEV_AU_CMRec** 219474.63
- #define **OEPDEV_AU_EV** 27.21138

Typedefs

- using oepdev::SharedCPHF = std::shared_ptr< CPHF >

    CPHF object.

- using oepdev::SharedShellsIterator = std::shared_ptr< ShellCombinationsIterator >

    Iterator over shells as shared pointer.

- using oepdev::SharedAOIntsIterator = std::shared_ptr< AOIntegralsIterator >

    Iterator over AO integrals as shared pointer.

- using **oepdev::SharedQUAMBOData** = std::shared_ptr< QUAMBOData >
- using oepdev::SharedQUAMBO = std::shared_ptr< QUAMBO >

    Shared QUAMBO object.

- using oepdev::SharedWavefunctionUnion = std::shared_ptr< WavefunctionUnion >

    WavefunctionUnion.

Functions

- PSI_API void oepdev::preambule (void)

    Print preambule for module OEPDEV.

- template<typename... Args>
  std::string oepdev::string_sprintf (const char ∗format, Args... args)

    Format string output. Example: std::string text = oepdev::string_sprinff("Test %3d, %13.5f", 5, -10.5425);.

- PSI_API std::shared_ptr< SuperFunctional > oepdev::create_superfunctional (std::string name, Options &options)

    Set up DFT functional.

- PSI_API SharedBasisSet oepdev::create_basisset_by_copy (SharedBasisSet basis_ref, SharedMolecule molecule_target)

    Build BasisSet by Copy.

- PSI_API SharedBasisSet oepdev::create_atom_basisset_by_copy (SharedBasisSet basis_ref, SharedMolecule molecule_target, int idx_atom)

    Build BasisSet by Copy for a Particular Atom.

- PSI_API std::shared_ptr< Molecule > oepdev::extract_monomer (std::shared_ptr< const Molecule > molecule_dimer, int id)

    Extract molecule from dimer.

- PSI_API double oepdev::compute_distance (psi::SharedVector v1, psi::SharedVector v2)

     Compute distance between two points in nD space.

- PSI_API std::shared_ptr< Wavefunction > oepdev::solve_scf (std::shared_ptr< Molecule > molecule, std::shared_ptr< BasisSet > primary, std::shared_ptr< BasisSet > auxiliary, std::shared_ptr< BasisSet > guess, std::shared_ptr< SuperFunctional > functional, Options &options, std::shared_ptr< PSIO > psio, bool compute_mints=false)

     Solve RHF-SCF equations for a given molecule in a given basis set.

- PSI_API std::shared_ptr< Wavefunction > oepdev::solve_scf_sad (std::shared_ptr< Molecule > molecule, std::shared_ptr< BasisSet > primary, std::shared_ptr< BasisSet > auxiliary, std::vector< std::shared_ptr< BasisSet >> sad, std::vector< std::shared_ptr< BasisSet >> sad_fit, std::shared_ptr< SuperFunctional > functional, Options &options, std::shared_ptr< PSIO > psio, bool compute_mints=false)

     Solve RHF-SCF equations for a given molecule in a given basis set.

- PSI_API double oepdev::average_moment (std::shared_ptr< psi::Vector > moment)

     Compute the scalar magnitude of multipole moment.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > oepdev::calculate_JK (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Matrix > C)

     Compute the Coulomb and exchange integral matrices in MO basis.

- PSI_API double oepdev::calculate_idf_alpha_xc_energy (std::shared_ptr< psi::Wavefunction > wfn, std::vector< double > w, psi::SharedMatrix D, std::vector< psi::SharedMatrix > Al, std::vector< psi::SharedMatrix > Bl)

     Compute the IDF exchange-correlation energy.

- PSI_API double oepdev::calculate_idf_xc_energy (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Matrix > D, std::vector< std::shared_ptr< psi::Matrix >> f, std::vector< std::shared_ptr< psi::Matrix >> g, std::shared_ptr< psi::Vector > w, std::shared_ptr< psi::Vector > o, double N, double aN, double xiN, double AN, double wnorm)

     Compute the IDF exchange-correlation energy.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > **oepdev::calculate_JK_ints** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr)

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > oepdev::calculate_JK_r (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > Dij)

     Compute the Coulomb and exchange integral matrices in MO basis.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > **oepdev::calculate_JK_rb** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > Dij)

- PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_der_D (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > C, std::vector< std::shared_ptr< psi::Matrix >> A)

     Compute the derivative of exchange-correlation energy wrt the density matrix in MO-A basis.

- PSI_API double oepdev::calculate_e_xc (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > f, std::shared_ptr< psi::Matrix > C)

Compute the exchange-correlation energy from ERI in MO-SCF basis.

- PSI_API double **oepdev::calculate_e_apsg** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > fJ, std::shared_ptr< psi::Matrix > fK, std::shared_ptr< psi::Matrix > C)

- PSI_API psi::SharedMatrix **oepdev::calculate_de_apsg** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Vector > P, std::shared_ptr< psi::Matrix > AJ, std::shared_ptr< psi::Matrix > AKL, std::shared_ptr< psi::Matrix > aJ, std::shared_ptr< psi::Matrix > aKL, std::shared_ptr< psi::Matrix > C)

- PSI_API psi::SharedMatrix **oepdev::calculate_de_apsg_new** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Vector > P, std::shared_ptr< psi::Matrix > C, std::shared_ptr< psi::Matrix > A_J, std::shared_ptr< psi::Matrix > A_LK, std::shared_ptr< psi::Matrix > a_J, std::shared_ptr< psi::Matrix > a_LK)

- PSI_API psi::SharedMatrix **oepdev::calculate_unitary_uo_2** (psi::SharedVector Q, int n)

- PSI_API psi::SharedMatrix **oepdev::calculate_unitary_uo_2_1** (psi::SharedMatrix P, psi::SharedVector p)

- PSI_API std::shared_ptr< psi::Matrix > oepdev::matrix_power_derivative (std::shared_ptr< psi::Matrix > A, double g, double step)

  Compute the contracted derivative of power of a square and symmetric matrix.

- std::shared_ptr< psi::Matrix > oepdev::_calculate_DFI_Vel (std::shared_ptr< psi::IntegralFactory > f_aabb, std::shared_ptr< psi::IntegralFactory > f_abab, std::shared_ptr< psi::Matrix > d_b)

  Compute the Effective DFI Potential Matrix Due To Electrons.

- PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_DFI_Vel_JK (std::shared_ptr< psi::IntegralFactory > f_aabb, std::shared_ptr< psi::IntegralFactory > f_abab, std::shared_ptr< psi::Matrix > d_b)

  Compute the Effective DFI Coulomb+Exchange Potential Matrix Due To Electrons.

- PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_DFI_Vel_J (std::shared_ptr< psi::IntegralFactory > f_aabb, std::shared_ptr< psi::Matrix > d_b)

  Compute the Effective DFI Coulomb Potential Matrix Due To Electrons.

- PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_OEP_basisopt_V (const int &nt, std::shared_ptr< psi::IntegralFactory > f_pppt, std::shared_ptr< psi::Matrix > ca, std::shared_ptr< psi::Matrix > da)

  Compute the 2-Electron Part of the Effective OEP Matrix for Auxiliary Basis Set Optimization.

- PSI_API double oepdev::bs_optimize_projection (std::shared_ptr< psi::Matrix > ti, std::shared_ptr< psi::MintsHelper > mints, std::shared_ptr< psi::BasisSet > bsf_m, std::shared_ptr< psi::BasisSet > bsf_i)

  Compute the objective function value for auxiliary basis set optimization of OEPs.

Rotation of AO Space

16.7.1 Theory

The objective is to find the formulae for rotation matrices of the AO spaces as functions of the Cartesian 3 x 3 rotation matrices. It is obvious that *p*-type functions transform as a usual

Cartesian vectors. However, higher angular momentum functions transform in a more complex way.

Problem

Define a vectorized AO space *M* of rank $r > 1$ that is constructed from unique tensor components of fully symmetric *r*-th rank AO tensor populated in standard order,

$$M_{\{ab\ldots k\}} = M_{ab\ldots k} \quad \text{for} \quad a \le b \le \ldots \le k$$

Given a general rotation of Cartesian tensors

$$M_{ab\ldots k} = \sum_{a'b'\ldots k'} M_{a'b'\ldots k'} r_{a'a} r_{b'b} \cdots r_{k'k}$$

find closed expressions for the rotation matrix in reduced composite AO space obeying

$$M_{[ab\ldots k]} = \sum_{\{a'b'\ldots k'\}} M_{\{a'b'\ldots k'\}} R_{\{a'b'\ldots k'\},[ab\ldots k]}$$

In the derivations below the following identity of first-order partitioning will be of use:

$$\sum_{ab} M_{ab}\hat{s}_{ab} = \sum_{\{ab\}} M_{\{ab\}}\left(\hat{s}_{ab} + \Delta_{ab}\hat{s}_{ba}\right)$$

where

$$\Delta_{ab} \equiv 1 - \delta_{ab}$$

and the operator *s* of rank *r* acts as follows

$$s^{ab\ldots k}_{a'b'\ldots k'} \equiv \hat{s}_{a'b'\ldots k'} \underbrace{\mathbf{r} \otimes \mathbf{r} \otimes \cdots \otimes \mathbf{r}}_{r} = r_{a'a} r_{b'b} \cdots r_{k'k}$$

Rotation of 6D functions

The rotation of the full tensor AO space of rank 2 and dimensions (3,3) is given by

$$M_{ab} = \sum_{a'b'} M_{a'b'} r_{a'b} r_{b'b}$$

Applying the identity of first-order partitioning directly leads to the formula for a reduced 6D tensor rotation of rank 1 and dimension (6),

$$M_{[ab]} = \sum_{\{a'b'\}} M_{\{a'b'\}} R_{\{a'b'\},[ab]}$$

where the 6 x 6 rotation matrix is given by

$$R_{\{a'b'\},[ab]} = r_{a'a} r_{b'b} + \Delta_{a'b'} r_{b'a} r_{a'b}$$

Rotation of 10F functions

The rotation of the full tensor AO space of rank 3 and dimensions (3,3,3) is given by

$$M_{abc} = \sum_{a'b'c'} M_{a'b'c'} r_{a'b} r_{b'b} r_{c'c}$$

First of all, notice that one can perform the following partitioning

$$\sum_a \sum_{b \neq a} \sum_{c \neq b \neq a} M_{abc} \hat{s}_{abc} = \sum_{\{abc\}} M_{\{abc\}} \left(\hat{s}_{abc} + \hat{s}_{acb} + \hat{s}_{bac} + \hat{s}_{bca} + \hat{s}_{cab} + \hat{s}_{cba} \right)$$

Then, perform a partitioning of the triple sum,

$$\sum_{abc} M_{abc} \hat{s}_{abc} = \sum_a \sum_{b \neq a} \sum_{c \neq b \neq a} M_{abc} \hat{s}_{abc}$$
$$+ \sum_a \sum_{b \geq a} M_{abb} \hat{s}_{abb} + \sum_a \sum_{b < a} M_{abb} \hat{s}_{abb}$$
$$+ \sum_a \sum_{b > a} M_{aba} \hat{s}_{aba} + \sum_a \sum_{b < a} M_{aba} \hat{s}_{aba}$$
$$+ \sum_a \sum_{b > a} M_{bba} \hat{s}_{bba} + \sum_a \sum_{b < a} M_{bba} \hat{s}_{bba}$$

Using the first-order partitioning theorem and interchanging the dummy indices one finds that

$$M_{[abc]} = \sum_{\{a'b'c'\}} M_{\{a'b'c'\}} R_{\{a'b'c'\},[abc]}$$

where the 10 x 10 rotation matrix is given by

$$R_{\{a'b'c'\},[abc]} = \delta_{b'c'} \left(s^{abc}_{a'b'b'} + \Delta_{a'b'} \left\{ s^{abc}_{b'a'b'} + s^{abc}_{b'b'a'} \right\} \right)$$
$$+ \delta_{a'b'} \Delta_{b'c'} \left(s^{abc}_{c'a'a'} + s^{abc}_{a'c'a'} + s^{abc}_{a'a'c'} \right)$$
$$+ \Delta_{a'b'} \Delta_{b'c'} \left(s^{abc}_{a'b'c} + s^{abc}_{a'c'b'} + s^{abc}_{b'a'c'} + s^{abc}_{b'c'a'} + s^{abc}_{c'a'b'} + s^{abc}_{c'b'a'} \right)$$

and

$$s^{abc}_{a'b'c'} \equiv \hat{s}_{a'b'c'} \mathbf{r} \otimes \mathbf{r} \otimes \mathbf{r} = r_{a'a} r_{b'b} r_{c'c}$$

- psi::SharedMatrix oepdev::r6 (psi::SharedMatrix r)

  Compute the 6 x 6 rotation matrix of the 6D orbitals.
- void oepdev::populate (double **R, double **r, std::vector< int > idx_am, const int &nam)

  Compute the 6 x 6 rotation matrix of the 6D orbitals.
- psi::SharedMatrix oepdev::ao_rotation_matrix (psi::SharedMatrix r, psi::SharedBasisSet b)

  Compute the full rotation matrix of AO orbital space.

16.7.2 Detailed Description

16.7.3 Function Documentation

16.7.3.1 _calculate_DFI_Vel()

```
std::shared_ptr< psi::Matrix > oepdev::_calculate_DFI_Vel (
        std::shared_ptr< psi::IntegralFactory > f_aabb,
        std::shared_ptr< psi::IntegralFactory > f_abab,
        std::shared_ptr< psi::Matrix > d_b )
```

Potential is felt by molecule A and induced by electrons in molecule B.

Parameters

f_aabb	- IntegralFactory of type (AA|BB)
f_abab	- IntegralFactory of type (AB|AB)
d_b	- one-particle density matrix in AO basis of B

Returns

- V_el(B) matrix in AO basis set of A

If f_abab is nullptr, then only Coulomb matrix is computed. Otherwise, also exchange contribution is computed.

16.7.3.2 ao_rotation_matrix()

```
psi::SharedMatrix oepdev::ao_rotation_matrix (
        psi::SharedMatrix r,
        psi::SharedBasisSet b )
```

Parameters

r	- Cartesian 3 x 3 rotation matrix
b	- Basis set

16.7.3.3 average_moment()

```
PSI_API double oepdev::average_moment (
        std::shared_ptr< psi::Vector > moment )
```

Parameters

moment	- multipole moment vector with unique matrix elements. Now supported only for dipole and quadrupole.

Returns

    - the average multipole moment value.

The magnitudes of multipole moments are defined here as follows:

- The dipole moment magnitude is just a norm

$$|\boldsymbol{\mu}| \equiv \sqrt{\mu_x^2 + \mu_y^2 + \mu_z^2}$$

- The quadrupole moment magnitude refers to the traceless moment in Buckingham convention

$$|\Theta| \equiv \sqrt{\Theta_{zz}^2 + \frac{1}{3}\left(\Theta_{xx} - \Theta_{yy}\right)^2 + \frac{4}{3}\left(\Theta_{xy}^2 + \Theta_{xz}^2 + \Theta_{yz}^2\right)}$$

    In the above equation, the quadrupole moment elements refer to its traceless form.

16.7.3.4 bs_optimize_projection()

```
PSI_API double oepdev::bs_optimize_projection (
        std::shared_ptr< psi::Matrix > ti,
        std::shared_ptr< psi::MintsHelper > mints,
        std::shared_ptr< psi::BasisSet > bsf_m,
        std::shared_ptr< psi::BasisSet > bsf_i )
```

Parameters

ti	- Ti matrix
mints	- integral helper (instantiated with bsf_i)
bsf_m	- auxiliary AO basis to optimize
bsf_i	- intermediate AO basis

Returns

    value of objective function equal to negative trace of overlap matrix

16.7.3.5 calculate_der_D()

```
PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_der_D (
        std::shared_ptr< psi::Wavefunction > wfn,
        std::shared_ptr< psi::IntegralTransform > tr,
        std::shared_ptr< psi::Matrix > C,
        std::vector< std::shared_ptr< psi::Matrix >> A )
```

Reads the existing MO ERI's.

Parameters

wfn	- Wavefunction object
tr	- IntegralTransform object
C	- Transformation matrix MO-B::MO-A (columns are MO-A basis)
A	- Vector of matrices A$^\wedge$(n)_{bd}

Returns

> - derivative matrix in MO-A basis

16.7.3.6   calculate_DFI_Vel_J()

```
PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_DFI_Vel_J (
          std::shared_ptr< psi::IntegralFactory > f_aabb,
          std::shared_ptr< psi::Matrix > d_b )
```

Potential is felt by molecule A and induced by electrons in molecule B.

Parameters

f_aabb	- IntegralFactory of type (AA|BB)
d_b	- one-particle density matrix in AO basis of B

Returns

> - V_el(B) matrix in AO basis set of A

16.7.3.7   calculate_DFI_Vel_JK()

```
PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_DFI_Vel_JK (
          std::shared_ptr< psi::IntegralFactory > f_aabb,
          std::shared_ptr< psi::IntegralFactory > f_abab,
          std::shared_ptr< psi::Matrix > d_b )
```

Potential is felt by molecule A and induced by electrons in molecule B.

Parameters

f_aabb	- IntegralFactory of type (AA|BB)
f_abab	- IntegralFactory of type (AB|AB)
d_b	- one-particle density matrix in AO basis of B

Returns

      - V_el(B) matrix in AO basis set of A

16.7.3.8 calculate_e_xc()

```
PSI_API double oepdev::calculate_e_xc (
        std::shared_ptr< psi::Wavefunction > wfn,
        std::shared_ptr< psi::IntegralTransform > tr,
        std::shared_ptr< psi::Matrix > f,
        std::shared_ptr< psi::Matrix > C )
```

Reads the existing MO ERI's.

Parameters

wfn	- Wavefunction object
tr	- IntegralTransform object
f	- f_ij matrix in MO-NEW basis
C	- Transformation matrix MO-SCF::MO-NEW (columns are MO-A basis)

Returns

      - Exchange-correlation energy

16.7.3.9 calculate_idf_alpha_xc_energy()

```
PSI_API double oepdev::calculate_idf_alpha_xc_energy (
        std::shared_ptr< psi::Wavefunction > wfn,
        std::vector< double > w,
        psi::SharedMatrix D,
        std::vector< psi::SharedMatrix > Al,
        std::vector< psi::SharedMatrix > Bl )
```

TODO Provide matrices in AO basis!

16.7.3.10 calculate_idf_xc_energy()

```
PSI_API double oepdev::calculate_idf_xc_energy (
        std::shared_ptr< psi::Wavefunction > wfn,
        std::shared_ptr< psi::Matrix > D,
        std::vector< std::shared_ptr< psi::Matrix >> f,
        std::vector< std::shared_ptr< psi::Matrix >> g,
        std::shared_ptr< psi::Vector > w,
```

```
        std::shared_ptr< psi::Vector > o,
        double N,
        double aN,
        double xiN,
        double AN,
        double wnorm )
```

TODO Provide matrices in AO basis!

16.7.3.11 calculate_JK()

```
PSI_API std::vector< std::shared_ptr< psi::Matrix > > oepdev::calculate_JK
(
        std::shared_ptr< psi::Wavefunction > wfn,
        std::shared_ptr< psi::Matrix > C )
```

Transforms the AO ERI's based on provided C matrix.

Parameters

wfn	- Wavefunction object
C	- molecular orbital coefficients (AO x MO)

Returns

- vector with J_ij and K_ij matrix

16.7.3.12 calculate_JK_r()

```
PSI_API std::vector< std::shared_ptr< psi::Matrix > > oepdev::calculate_JK_r
(
        std::shared_ptr< psi::Wavefunction > wfn,
        std::shared_ptr< psi::IntegralTransform > tr,
        std::shared_ptr< psi::Matrix > Dij )
```

Reads the existing MO ERI's.

Parameters

wfn	- Wavefunction object
tr	- IntegralTransform object
D	- density matrix in MO basis

Returns

    - vector with J_ij and K_ij matrix

16.7.3.13 calculate_OEP_basisopt_V()

```
PSI_API std::shared_ptr< psi::Matrix > oepdev::calculate_OEP_basisopt_V (
        const int & nt,
        std::shared_ptr< psi::IntegralFactory > f_pppt,
        std::shared_ptr< psi::Matrix > ca,
        std::shared_ptr< psi::Matrix > da )
```

Parameters

nt	- number of test basis functions
f_pppt	- [IntegralFactory](#) of type (PP|PT)
ca	- target MOs
da	- one-particle density matrix in AO basis

Returns

    - V matrix

16.7.3.14 compute_distance()

```
PSI_API double oepdev::compute_distance (
        psi::SharedVector v1,
        psi::SharedVector v2 )
```

Parameters

v1	- vector 1
v2	- vector 2

Returns

    distance The vectors have to have the same length.

16.7.3.15 create_atom_basisset_by_copy()

```
PSI_API SharedBasisSet oepdev::create_atom_basisset_by_copy (
```

```
SharedBasisSet basis_ref,
SharedMolecule molecule_target,
int idx_atom )
```

Parameters

basis_ref	- reference basis set
molecule_target	- target molecule (atom in this case)
idx_atom	- index of an atom in basis_ref->molecule()

Returns

psi::SharedBasisSet object.

16.7.3.16 create_basisset_by_copy()

```
PSI_API SharedBasisSet oepdev::create_basisset_by_copy (
SharedBasisSet basis_ref,
SharedMolecule molecule_target )
```

Parameters

basis_ref	- reference basis set
molecule_target	- target molecule

Returns

psi::SharedBasisSet object.

16.7.3.17 create_superfunctional()

```
PSI_API std::shared_ptr< SuperFunctional > oepdev::create_superfunctional (
std::string name,
Options & options )
```

Now it accepts only pure HF functional.

Parameters

name	name of the functional ("HF" is now only available)
options	psi::Options object

Returns

psi::SharedSuperFunctional object with functional.

Examples:

example_scf_perturb.cc.

16.7.3.18 extract_monomer()

```
PSI_API std::shared_ptr< Molecule > oepdev::extract_monomer (
        std::shared_ptr< const Molecule > molecule_dimer,
        int id )
```

Parameters

molecule_dimer	psi::SharedMolecule object with dimer
id	index of a molecule (starts from 1)

Returns

psi::SharedMolecule object with indicated monomer

16.7.3.19 matrix_power_derivative()

```
PSI_API std::shared_ptr< psi::Matrix > oepdev::matrix_power_derivative (
        std::shared_ptr< psi::Matrix > A,
        double g,
        double step )
```

The contracted matrix derivative is defined here as

$$\mathbf{D} = \frac{d\mathbf{A}^{\gamma}}{\mathbf{A}} : \mathbb{I}$$

where $\mathbb{I}$ is the identity matrix. The derivative, which is the fourth-rank tensor, is computed by the forward 2-centre finite difference formula,

$$f' = (f(h) - f(0)) / h$$

- if γ is non-integer, input matrix has to be positive-definite.

Parameters

A	- Matrix
g	- Power
step	- Differentiation step h

Returns

> - Contracted derivative (matrix)

16.7.3.20 populate()

```
void oepdev::populate (
        double ** R,
        double ** r,
        std::vector< int > idx_am,
        const int & nam )
```

Compute the 10 x 10 rotation matrix of the 10F orbitals.

Parameters

| r | - Cartesian 3 x 3 rotation matrix |

Returns

> 6 x 6 rotation matrix of the 6D orbitals

Parameters

| r | - Cartesian 3 x 3 rotation matrix |

Returns

> 10 x 10 rotation matrix of the 10F orbitals

16.7.3.21 r6()

```
psi::SharedMatrix oepdev::r6 (
        psi::SharedMatrix r )
```

Compute the 10 x 10 rotation matrix of the 10F orbitals.

Parameters

| r | - Cartesian 3 x 3 rotation matrix |

Returns

> 6 x 6 rotation matrix of the 6D orbitals

Parameters

| r | - Cartesian 3 x 3 rotation matrix |

Returns

> 10 x 10 rotation matrix of the 10F orbitals

16.7.3.22 solve_scf()

```
PSI_API std::shared_ptr< Wavefunction > oepdev::solve_scf (
          std::shared_ptr< Molecule > molecule,
          std::shared_ptr< BasisSet > primary,
          std::shared_ptr< BasisSet > auxiliary,
          std::shared_ptr< BasisSet > guess,
          std::shared_ptr< SuperFunctional > functional,
          Options & options,
          std::shared_ptr< PSIO > psio,
          bool compute_mints = false )
```

Parameters

molecule	psi::SharedMolecule object with molecule
primary	basis set
auxiliary	basis set
guess	basis set
functional	DFT functional
options	psi::Options object
psio	psi::PSIO object
compute_mints	Compute integrals (write IWL TOC entry - necessary when transforming integrals)

Returns

> psi::SharedWavefunction SCF wavefunction of the molecule

16.7.3.23 solve_scf_sad()

```
PSI_API std::shared_ptr< Wavefunction > oepdev::solve_scf_sad (
```

```
std::shared_ptr< Molecule > molecule,
std::shared_ptr< BasisSet > primary,
std::shared_ptr< BasisSet > auxiliary,
std::vector< std::shared_ptr< BasisSet >> sad,
std::vector< std::shared_ptr< BasisSet >> sad_fit,
std::shared_ptr< SuperFunctional > functional,
Options & options,
std::shared_ptr< PSIO > psio,
bool compute_mints = false )
```

Parameters

molecule	psi::SharedMolecule object with molecule
primary	shared primary basis set
auxiliary	shared auxiliary basis set
sad	SAD basis set list
sad_fit	SAD DF fitting basis set list
functional	DFT functional
options	psi::Options object
psio	psi::PSIO object
compute_mints	Compute integrals (write IWL TOC entry - necessary when transforming integrals)

Returns

psi::SharedWavefunction SCF wavefunction of the molecule

16.8 The OEPDev Testing Platform Library

Testing platform at C++ level of code. You should add more tests here when developing new functionalities, theories or models. Located at `oepdev/libtest`.

Classes

- class [oepdev::test::Test]

  Manages test routines.

16.8.1 Detailed Description

Chapter 17

Namespace Documentation

17.1 gefp.basis._util Namespace Reference

Functions

- def **COMPARE** (a, b, i=None)

17.1.1 Detailed Description

```
Local utilities (protected interface)

BB, 29.07.2020, Gundelfingen
```

17.2 gefp.basis.edf Namespace Reference

Functions

- def **compute_v** (Ca, Da, prim, left_axis)
- def **projection** (c_a, s_ab, s_bb)
- def **projected_t** (c_a, s_ab, s_bb)
- def **projected_o** (c_a, s_ab, s_bb)
- def **obj_numpy** (param, t_i, bsf_i, dfbasis)
- def **obj_oepdev** (param, t_i, bsf_i, dfbasis, mints)
- def **find_aux_mo_mini** (G, S, I=None, eps=0.0001)
- def **optimize_ao_mini** (t_i, bsf_i, dfbasis, opt_global, cpp=False, maxiter_micro=2000, maxiter_macro=10)

Variables

- **matrix_power** = scipy.linalg.fractional_matrix_power

17.2.1 Detailed Description

```
Extended Density Fitting Helper Library.

Useful routines for AO basis set optimization can be found here.

BB, 29.07.2020, Gundelfingen
```

17.3 gefp.basis.optimize Namespace Reference

Classes

- class DFBasis
- class DFBasisOptimizer
- class OEP
- class OEP_CT
- class OEP_FockLike
- class OEP_Pauli

Functions

- def **make_bastempl** (templ, param)
- def **oepfitbasis** (mol, role='ORBITAL')
- def **removeComments** (string)
- def oep_ao_basis_set_optimizer (wfn, interm, test=None, exemplary=None, target="OCC", cpp=False, more_info=False, maxiter=2000, templ_file='templ.dat', param_file='param.dat', bound_file=None, constraints=(), outname='oepfit.gbs', opt_global=False, global_iter=10, standardized_input=None)

17.3.1 Detailed Description

```
Auxiliary Basis Set Optimization Library.

The auxiliary basis sets for generalized density fitting (GDF)
are here optimized.
```

17.3.2 Function Documentation

17.3.2.1 oep_ao_basis_set_optimizer()

```
def gefp.basis.optimize.oep_ao_basis_set_optimizer (
            wfn,
```

```
            interm,
            test = None,
            exemplary = None,
            target = "OCC",
            cpp = False,
            more_info = False,
            maxiter = 2000,
            templ_file = 'templ.dat',
            param_file = 'param.dat',
            bound_file = None,
            constraints = (),
            outname = 'oepfit.gbs',
            opt_global = False,
            global_iter = 10,
            standardized_input = None )
```

```
 Method that optimizes DF basis set.
 This is currently the state-of-the-art and recommended.
```

17.4 gefp.basis.optimize_bcp Namespace Reference

Classes

- class DFBasis
- class DFBasisOptimizer
- class OEP
- class OEP_CT
- class OEP_FockLike
- class OEP_Pauli

Functions

- def **make_bastempl** (templ, param)
- def **oepfitbasis** (mol, role='ORBITAL')
- def **removeComments** (string)
- def **compute_error** (basis, oep, rms=False)
- def **objective_function** (param, oep)

17.4.1 Detailed Description

```
 Auxiliary Basis Set Optimization Library.
```

```
 The auxiliary basis sets for generalized density fitting (GDF)
 are here optimized.
```

17.5 gefp.basis.parameters Namespace Reference

Classes

- class StandardizedInput
- class TakeMyStandardSteps

17.5.1 Detailed Description

```
Parameters for Basis Set Optimization Module

Contains:
   o standard templates for auxiliary minimal AO basis set
   o guess parameters for auxiliary minimal AO basis set optimization
   o automatized basin hopping bound and step adjustment tools

BB, 30.07.2020, Gundelfingen
```

17.6 gefp.basis.template.extended Namespace Reference

Variables

- dictionary **extended_template_by_row** = {}
- dictionary **extended_bounds_codes_by_row** = {}
- string **b1** = " E C E C E C"
- dictionary **extended_guess_parameters_by_atom** = {}
- float **s** = 0.3
- dictionary **extended_scales_by_row** = {}

17.6.1 Detailed Description

```
Extended Templates for AO Basis Set Optimization

BB, 04.08.2020, Gundelfingen
```

17.7 gefp.basis.template.standard Namespace Reference

Variables

- dictionary **atoms_by_row** = {}
- dictionary **standard_template_by_row** = {}
- dictionary **standard_bounds_codes_by_row** = {}
- string **b1** = " E C E C E C"

- dictionary **standard_guess_parameters_by_atom** = {}
- dictionary **reference_symbol_by_row** = {}
- float **s** = 0.3
- dictionary **standard_scales_by_row** = {}

17.7.1 Detailed Description

```
Standard Templates for AO Basis Set Optimization
```

```
BB, 04.08.2020, Gundelfingen
```

17.8 gefp.density.dfi Namespace Reference

Classes

- class DFI
- class DFI_J
- class DFI_JK
- class SCF

Variables

- int **MAX_NBF** = 128

17.8.1 Detailed Description

```
Demonstrates the use of Psi4 from Python level.
Useful notes:
 o Use psi4.core module for most of the work
 o Useful modules within psi4.core:
   - MintsHelper
   - Molecule
   - BasisSet
   - ExternalPotential
   others
 o Psi4 defines its own matrix type (psi4.core.Matrix).
   Extracting numpy.array is easy:
     numpy_array = numpy.asarray(psi4_matrix)
   Creating Psi4 matrix from array is also easy:
     psi4_matrix = psi4.core.Matrix.from_array(numpy_array)
 o To compute 1-el potential matrix for a set of charges
   use ExternalPotential (charge positions are to be provided in Angstroms)
   unless charges are just nuclei within the basis set (in this case use of ao_potentia
   of MintsHelper is easier).
 o ao_potential method of MintsHelper is limited only for nuclei within the same basis
   (the nuclei are taken from the first basis set axis, for example:
     mints = MintsHelper(basis_X)
     mints.ao_potential()              -> nuclei taken from basis of mints object (b
```

```
      mints.ao_potential(basis_1, basis_2) -> nuclei taken from basis_1
  o Psi4 has efficient and easy to use method of defining fragments within a molecule (u
    Defining ghost atoms and extracting fragment i in the multimer-centred basis set is
    (method extract_subsets(...) of psi4.core.Molecule)
```

17.9 gefp.density.population Namespace Reference

Classes

- class Loc

Functions

- def atomic_charges (wfn, kappa=0.0)

17.9.1 Detailed Description

```
 Module for population analyses.
 Bartosz B␣lasiak, Gundelfingen, September 2019

 Notes:
   Copied from my QC Workshop.
   Reference: https://github.com/globulion/qc-workshop/tree/master/tutor/project_1#popul
```

17.9.2 Function Documentation

17.9.2.1 atomic_charges()

```
def gefp.density.population.atomic_charges (
          wfn,
          kappa = 0.0 )
```

```
 Compute atomic partial charges as a function of kappa parameter.

 Input:
   wfn   - psi4.core.Wavefunction object
   kappa - parameter in the interval [0, 1]

 Returns:
   numpy.ndarray of shape (wfn.molecule().natom(), ) with partial charges [A.U.]

 Notes:
   o kappa = 0 corresponds to Mulliken charges
   o kappa = 1/2 corresponds to Lowdin charges
```

17.10 oepdev Namespace Reference

OEPDev module namespace.

Classes

- struct ABCD

    Simple structure to hold the Fourier series expansion coefficients.
- class AbInitioPolarGEFactory

    Polarization GEFP Factory from First Principles. Hartree-Fock Approximation.
- class AllAOIntegralsIterator_2

    Loop over all possible ERI within a particular shell doublet.
- class AllAOIntegralsIterator_4

    Loop over all possible ERI within a particular shell quartet.
- class AllAOShellCombinationsIterator_2

    Loop over all possible ERI shells in a shell doublet.
- class AllAOShellCombinationsIterator_4

    Loop over all possible ERI shells in a shell quartet.
- class AOIntegralsIterator

    Iterator for AO Integrals. Abstract Base.
- class CAMM

    Cumulative Atomic Multipole Moments.
- class ChargeTransferEnergyOEPotential

    Generalized One-Electron Potential for Charge-Transfer Interaction Energy.
- class ChargeTransferEnergySolver

    Compute the Charge-Transfer interaction energy between unperturbed wavefunctions.
- class CISComputer

    CISComputer.
- struct CISData

    CIS wavefunction parameters. Container structure.
- class CPHF

    CPHF solver class.
- class CubePoints3DIterator

    Iterator over a collection of points in 3D space. g09 Cube-like order.
- class CubePointsCollection3D

    G09 cube-like ordered collection of points in 3D space.
- class DavidsonLiu

    Davidson-Liu diagonalization method.
- class DIISManager

    DIIS manager.

- class DMTPole

    Distributed Multipole Analysis Container and Computer. Abstract Base.

- class DoubleGeneralizedDensityFit

    Generalized Density Fitting Scheme - Double Fit.

- class EETCouplingOEPotential

    Generalized One-Electron Potential for EET coupling calculations.

- class EETCouplingSolver

    Compute the EET coupling energy between unperturbed wavefunctions.

- class EFP2_GEFactory

    EFP2 GEFP Factory.

- class EFPMultipolePotentialInt

    Computes potential integrals.

- class ElectrostaticEnergyOEPotential

    Generalized One-Electron Potential for Electrostatic Energy.

- class ElectrostaticEnergySolver

    Compute the Coulombic interaction energy between unperturbed wavefunctions.

- class ElectrostaticPotential3D

    Electrostatic potential of a molecule.

- class ERI_1_1

    2-centre ERI of the form $(a|O(2)|b)$ where $O(2) = 1/r12$.

- class ERI_2_2

    4-centre ERI of the form $(ab|O(2)|cd)$ where $O(2) = 1/r12$.

- class ERI_3_1

    4-centre ERI of the form $(abc|O(2)|d)$ where $O(2) = 1/r12$.

- class ESPSolver

    Charges from Electrostatic Potential (ESP). A solver-type class.

- class FFAbInitioPolarGEFactory

    Polarization GEFP Factory from First Principles: Finite-Difference Model. Arbitrary level of theory.

- class Field3D

    General Vector Dield in 3D Space. Abstract base.

- struct Fourier5

    Simple structure to hold the Fourier series expansion coefficients for N=2.

- struct Fourier9

    Simple structure to hold the Fourier series expansion coefficients for N=4.

- class FragmentedSystem

    Molecular System for Fragment-Based Calculations.

- class GenEffFrag

    Generalized Effective Fragment. Container Class.

- class GenEffPar

Generalized Effective Fragment Parameters. Container Class.

- class GenEffParFactory

  Generalized Effective Fragment Factory. Abstract Base.

- class GeneralizedDensityFit

  Generalized Density Fitting Scheme. Abstract Base.

- class GeneralizedPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class GramSchmidt

  Gram-Schmidt orthogonalization method.

- class IntegralFactory

  Extended IntegralFactory for computing integrals.

- class KabschSuperimposer

  Compute the Cartesian rotation matrix between two structures.

- class LinearGradientNonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class LinearNonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class LinearUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class MultipoleConvergence

  Multipole Convergence.

- class NonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class ObaraSaikaTwoCenterEFPRecursion_New

  Obara-Saika recursion formulae for improved EFP multipole potential integrals.

- class OEP_EFP2_GEFactory

  OEP-EFP2 GEFP Factory.

- class OEPDevSolver

  Solver of properties of molecular aggregates. Abstract base.

- class OEPotential

  Generalized One-Electron Potential: Abstract base.

- class OEPotential3D

  Class template for OEP 3D fields.

- struct OEPType

  Container to handle the type of One-Electron Potentials.

- class OverlapGeneralizedDensityFit

  Generalized Density Fitting Scheme - Single Fit Based on Minimal Overlap in MO Basis.

- struct PerturbCharges

  Structure to hold perturbing charges.

- class Points3DIterator

Iterator over a collection of points in 3D space. Abstract base.

- class PointsCollection3D

  Collection of points in 3D space. Abstract base.

- class PolarGEFactory

  Polarization GEFP Factory. Abstract Base.

- class PotentialInt

  Computes potential integrals.

- class QuadraticGradientNonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class QuadraticNonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class QuadraticUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class QUAMBO

  The Quasiatomic Minimal Basis Set Molecular Orbitals (QUAMBO)

- struct QUAMBOData

  Container to store the QUAMBO data.

- class R_CISComputer
- class R_CISComputer_Direct
- class R_CISComputer_DL

  CIS Computer with RHF reference: Davidson-Liu Solver.

- class R_CISComputer_Explicit
- class RandomPoints3DIterator

  Iterator over a collection of points in 3D space. Random collection.

- class RandomPointsCollection3D

  Collection of random points in 3D space.

- class RepulsionEnergyOEPotential

  Generalized One-Electron Potential for Pauli Repulsion Energy.

- class RepulsionEnergySolver

  Compute the Pauli-Repulsion interaction energy between unperturbed wavefunctions.

- class RHFPerturbed

  RHF theory under electrostatic perturbation.

- class ShellCombinationsIterator

  Iterator for Shell Combinations. Abstract Base.

- class SingleGeneralizedDensityFit

  Generalized Density Fitting Scheme - Single Fit.

- class TIData

  Transfer Integral EET Data.

- class TwoBodyAOInt
- class TwoElectronInt

General Two Electron Integral.

- class U_CISComputer
- class U_CISComputer_DL

    CIS Computer with UHF reference: Davidson-Liu Solver.

- class U_CISComputer_Explicit
- class UniformEFieldPolarGEFactory

    Polarization GEFP Factory with Least-Squares Parameterization.

- class UnitaryOptimizer

    Find the optimim unitary matrix of quadratic matrix equation.

- class UnitaryOptimizer_2

    Find the optimim unitary matrix for quadratic matrix equation with trace.

- class UnitaryOptimizer_2_1
- class UnitaryOptimizer_4_2

    Find the optimim unitary matrix for quartic-quadratic matrix equation with trace.

- class UnitaryTransformedMOPolarGEFactory

    Polarization GEFP Factory with Least-Squares Scaling of MO Space.

- class WavefunctionUnion

    Union of two Wavefunction objects.

Typedefs

- using SharedDMTPole = std::shared_ptr< DMTPole >

    DMTPole object.

Functions

- double d_N_n1_n2 (int N, int n1, int n2, double PA, double PB, double aP)

  Compute McMurchie-Davidson-Hermite (MDH) coefficient for binomial expansion.
- void make_mdh_D2_coeff_explicit_recursion (int n1, int n2, double aP, double ∗PA, double ∗PB, double ∗buffer)

  Compute the McMurchie-Davidson-Hermite coefficients for binomial expansion by explicit recursion. This function makes the same changes to buffers as oepdev::make_mdh_D2_coeff, but implements it through explicit recursion by calls to oepdev::d_N_n1_n2. Therefore, it is slightly slower. Here for debugging purposes.
- void make_mdh_D1_coeff (int n1, double aPd, double ∗buffer)

  Compute the McMurchie-Davidson-Hermite coefficients for monomial expansion.
- void make_mdh_D2_coeff (int n1, int n2, double aPd, double ∗PA, double ∗PB, double ∗buffer)

  Compute the McMurchie-Davidson-Hermite coefficients for binomial expansion.
- void make_mdh_D3_coeff (int n1, int n2, int n3, double aPd, double ∗PA, double ∗PB, double ∗PC, double ∗buffer)

  Compute the McMurchie-Davidson-Hermite coefficients for trinomial expansion.
- void make_mdh_R_coeff (int N, int L, int M, double alpha, double a, double b, double c, double ∗F, double ∗buffer)

  Compute the McMurchie-Davidson R coefficients.
- double ∗ ∗ ∗ **init_box** (int a, int b, int c)
- void **zero_box** (double ∗∗∗box, int a, int b, int c)
- void **free_box** (double ∗∗∗box, int a, int b)

- psi::SharedMatrix **r10** (psi::SharedMatrix r3)
- constexpr std::complex< double > **operator""_i** (unsigned long long d)
- constexpr std::complex< double > **operator""_i** (long double d)
- PSI_API void preambule (void)

    Print preambule for module OEPDEV.

- PSI_API std::shared_ptr< SuperFunctional > create_superfunctional (std::string name, Options &options)

    Set up DFT functional.

- PSI_API SharedBasisSet create_basisset_by_copy (SharedBasisSet basis_ref, Shared-Molecule molecule_target)

    Build BasisSet by Copy.

- PSI_API SharedBasisSet create_atom_basisset_by_copy (SharedBasisSet basis_ref, SharedMolecule molecule_target, int idx_atom)

    Build BasisSet by Copy for a Particular Atom.

- PSI_API std::shared_ptr< Molecule > extract_monomer (std::shared_ptr< const Molecule > molecule_dimer, int id)

    Extract molecule from dimer.

- PSI_API double compute_distance (psi::SharedVector v1, psi::SharedVector v2)

    Compute distance between two points in nD space.

- PSI_API std::shared_ptr< Wavefunction > solve_scf (std::shared_ptr< Molecule > molecule, std::shared_ptr< BasisSet > primary, std::shared_ptr< BasisSet > auxiliary, std::shared_ptr< BasisSet > guess, std::shared_ptr< SuperFunctional > functional, Options &options, std::shared_ptr< PSIO > psio, bool compute_mints=false)

    Solve RHF-SCF equations for a given molecule in a given basis set.

- PSI_API std::shared_ptr< Wavefunction > solve_scf_sad (std::shared_ptr< Molecule > molecule, std::shared_ptr< BasisSet > primary, std::shared_ptr< BasisSet > auxiliary, std::vector< std::shared_ptr< BasisSet >> sad, std::vector< std::shared_ptr< BasisSet >> sad_fit, std::shared_ptr< SuperFunctional > functional, Options &options, std::shared_ptr< PSIO > psio, bool compute_mints=false)

    Solve RHF-SCF equations for a given molecule in a given basis set.

- PSI_API double average_moment (std::shared_ptr< psi::Vector > moment)

    Compute the scalar magnitude of multipole moment.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > calculate_JK (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Matrix > C)

    Compute the Coulomb and exchange integral matrices in MO basis.

- PSI_API double **calculate_idf_alpha_xc_energy** (std::shared_ptr< psi::Wavefunction > wfn, std::vector< double > w, std::shared_ptr< psi::Matrix > D, std::vector< std::shared_ptr< psi::Matrix >> Al, std::vector< std::shared_ptr< psi::Matrix >> Bl)
- PSI_API double calculate_idf_xc_energy (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Matrix > D, std::vector< std::shared_ptr< psi::Matrix >> f, std::vector< std::shared_ptr< psi::Matrix >> g, std::shared_ptr< psi::Vector > w, std::shared_ptr< psi::Vector > o, double N, double aN, double xiN, double AN, double wnorm)

    Compute the IDF exchange-correlation energy.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > **calculate_JK_ints** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr)
- PSI_API std::vector< std::shared_ptr< psi::Matrix > > calculate_JK_r (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > Dij)

  Compute the Coulomb and exchange integral matrices in MO basis.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > **calculate_JK_rb** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > Dij)
- PSI_API std::shared_ptr< psi::Matrix > calculate_der_D (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > C, std::vector< std::shared_ptr< psi::Matrix >> A)

  Compute the derivative of exchange-correlation energy wrt the density matrix in MO-A basis.

- PSI_API double calculate_e_xc (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > f, std::shared_ptr< psi::Matrix > C)

  Compute the exchange-correlation energy from ERI in MO-SCF basis.

- PSI_API double **calculate_e_apsg** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Matrix > fJ, std::shared_ptr< psi::Matrix > fK, std::shared_ptr< psi::Matrix > C)
- PSI_API psi::SharedMatrix **calculate_de_apsg** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr, std::shared_ptr< psi::Vector > P, std::shared_ptr< psi::Matrix > AJ, std::shared_ptr< psi::Matrix > AKL, std::shared_ptr< psi::Matrix > aJ, std::shared_ptr< psi::Matrix > aKL, std::shared_ptr< psi::Matrix > C)
- PSI_API psi::SharedMatrix **calculate_de_apsg_new** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Vector > P, std::shared_ptr< psi::Matrix > C, std::shared_ptr< psi::Matrix > A_J, std::shared_ptr< psi::Matrix > A_LK, std::shared_ptr< psi::Matrix > a_J, std::shared_ptr< psi::Matrix > a_LK)
- PSI_API psi::SharedMatrix **calculate_unitary_uo_2** (psi::SharedVector Q, int n)
- PSI_API psi::SharedMatrix **calculate_unitary_uo_2_1** (psi::SharedMatrix P, psi::SharedVector p)
- PSI_API std::shared_ptr< psi::Matrix > matrix_power_derivative (std::shared_ptr< psi::Matrix > A, double g, double step)

  Compute the contracted derivative of power of a square and symmetric matrix.

- std::shared_ptr< psi::Matrix > _calculate_DFI_Vel (std::shared_ptr< psi::IntegralFactory > f_aabb, std::shared_ptr< psi::IntegralFactory > f_abab, std::shared_ptr< psi::Matrix > d_b)

  Compute the Effective DFI Potential Matrix Due To Electrons.

- PSI_API std::shared_ptr< psi::Matrix > calculate_DFI_Vel_JK (std::shared_ptr< psi::IntegralFactory > f_aabb, std::shared_ptr< psi::IntegralFactory > f_abab, std::shared_ptr< psi::Matrix > d_b)

  Compute the Effective DFI Coulomb+Exchange Potential Matrix Due To Electrons.

- PSI_API std::shared_ptr< psi::Matrix > calculate_DFI_Vel_J (std::shared_ptr< psi::IntegralFactory > f_aabb, std::shared_ptr< psi::Matrix > d_b)

  Compute the Effective DFI Coulomb Potential Matrix Due To Electrons.

- PSI_API std::shared_ptr< psi::Matrix > calculate_OEP_basisopt_V (const int &nt, std::shared_ptr< psi::IntegralFactory > f_pppt, std::shared_ptr< psi::Matrix > ca, std::shared_ptr< psi::Matrix > da)

  Compute the 2-Electron Part of the Effective OEP Matrix for Auxiliary Basis Set Optimization.

- PSI_API double bs_optimize_projection (std::shared_ptr< psi::Matrix > ti, std::shared_ptr< psi::MintsHelper > mints, std::shared_ptr< psi::BasisSet > bsf_m, std::shared_ptr< psi::BasisSet > bsf_i)

  Compute the objective function value for auxiliary basis set optimization of OEPs.

- template<typename... Args>
  std::string string_sprintf (const char ∗format, Args... args)

  Format string output. Example: std::string text = oepdev::string_sprinff("Test %3d, %13.5f", 5, -10.5425);.

- PSI_API double calculate_idf_alpha_xc_energy (std::shared_ptr< psi::Wavefunction > wfn, std::vector< double > w, psi::SharedMatrix D, std::vector< psi::SharedMatrix > AI, std::vector< psi::SharedMatrix > BI)

  Compute the IDF exchange-correlation energy.

Rotation of AO Space

17.10.1 Theory

The objective is to find the formulae for rotation matrices of the AO spaces as functions of the Cartesian 3 x 3 rotation matrices. It is obvious that p-type functions transform as a usual Cartesian vectors. However, higher angular momentum functions transform in a more complex way.

Problem

Define a vectorized AO space M of rank r>1 that is constructed from unique tensor components of fully symmetric r-th rank AO tensor populated in standard order,

$$M_{\{ab...k\}} = M_{ab...k} \quad \text{for} \quad a \leq b \leq ... \leq k$$

Given a general rotation of Cartesian tensors

$$M_{ab...k} = \sum_{a'b'...k'} M_{a'b'...k'} r_{a'a} r_{b'b} \cdots r_{k'k}$$

find closed expressions for the rotation matrix in reduced composite AO space obeying

$$M_{[ab...k]} = \sum_{\{a'b'...k'\}} M_{\{a'b'...k'\}} R_{\{a'b'...k'\},[ab...k]}$$

In the derivations below the following identity of first-order partitioning will be of use:

$$\sum_{ab} M_{ab} \hat{s}_{ab} = \sum_{\{ab\}} M_{\{ab\}} \left(\hat{s}_{ab} + \Delta_{ab} \hat{s}_{ba} \right)$$

where

$$\Delta_{ab} \equiv 1 - \delta_{ab}$$

and the operator s of rank r acts as follows

$$s^{ab...k}_{a'b'...k'} \equiv \hat{s}_{a'b'...k'} \underbrace{\mathbf{r} \otimes \mathbf{r} \otimes \cdots \otimes \mathbf{r}}_{r} = r_{a'a} r_{b'b} \cdots r_{k'k}$$

Rotation of 6D functions

The rotation of the full tensor AO space of rank 2 and dimensions (3,3) is given by

$$M_{ab} = \sum_{a'b'} M_{a'b'} r_{a'b} r_{b'b}$$

Applying the identity of first-order partitioning directly leads to the formula for a reduced 6D tensor rotation of rank 1 and dimension (6),

$$M_{[ab]} = \sum_{\{a'b'\}} M_{\{a'b'\}} R_{\{a'b'\},[ab]}$$

where the 6 x 6 rotation matrix is given by

$$R_{\{a'b'\},[ab]} = r_{a'a} r_{b'b} + \Delta_{a'b'} r_{b'a} r_{a'b}$$

Rotation of 10F functions

The rotation of the full tensor AO space of rank 3 and dimensions (3,3,3) is given by

$$M_{abc} = \sum_{a'b'c'} M_{a'b'c'} r_{a'b} r_{b'b} r_{c'c}$$

First of all, notice that one can perform the following partitioning

$$\sum_a \sum_{b \neq a} \sum_{c \neq b \neq a} M_{abc} \hat{s}_{abc} = \sum_{\{abc\}} M_{\{abc\}} (\hat{s}_{abc} + \hat{s}_{acb} + \hat{s}_{bac} + \hat{s}_{bca} + \hat{s}_{cab} + \hat{s}_{cba})$$

Then, perform a partitioning of the triple sum,

$$\begin{aligned}
\sum_{abc} M_{abc} \hat{s}_{abc} = &\sum_a \sum_{b \neq a} \sum_{c \neq b \neq a} M_{abc} \hat{s}_{abc} \\
&+ \sum_a \sum_{b \geq a} M_{abb} \hat{s}_{abb} + \sum_a \sum_{b < a} M_{abb} \hat{s}_{abb} \\
&+ \sum_a \sum_{b > a} M_{aba} \hat{s}_{aba} + \sum_a \sum_{b < a} M_{aba} \hat{s}_{aba} \\
&+ \sum_a \sum_{b > a} M_{bba} \hat{s}_{bba} + \sum_a \sum_{b < a} M_{bba} \hat{s}_{bba}
\end{aligned}$$

Using the first-order partitioning theorem and interchanging the dummy indices one finds that

$$M_{[abc]} = \sum_{\{a'b'c'\}} M_{\{a'b'c'\}} R_{\{a'b'c'\},[abc]}$$

where the 10 x 10 rotation matrix is given by

$$R_{\{a'b'c'\},[abc]} = \delta_{b'c'}\left(s^{abc}_{a'b'b'} + \Delta_{a'b'}\left\{s^{abc}_{b'a'b'} + s^{abc}_{b'b'a'}\right\}\right)$$
$$+ \delta_{a'b'}\Delta_{b'c'}\left(s^{abc}_{c'a'a'} + s^{abc}_{a'c'a'} + s^{abc}_{a'a'c'}\right)$$
$$+ \Delta_{a'b'}\Delta_{b'c'}\left(s^{abc}_{a'b'c} + s^{abc}_{a'c'b'} + s^{abc}_{b'a'c'} + s^{abc}_{b'c'a'} + s^{abc}_{c'a'b'} + s^{abc}_{c'b'a'}\right)$$

and

$$s^{abc}_{a'b'c'} \equiv \hat{s}_{a'b'c'}\mathbf{r}\otimes\mathbf{r}\otimes\mathbf{r} = r_{a'a}r_{b'b}r_{c'c}$$

- psi::SharedMatrix r6 (psi::SharedMatrix r)

  Compute the 6 x 6 rotation matrix of the 6D orbitals.
- void populate (double **R, double **r, std::vector< int > idx_am, const int &nam)

  Compute the 6 x 6 rotation matrix of the 6D orbitals.
- psi::SharedMatrix ao_rotation_matrix (psi::SharedMatrix r, psi::SharedBasisSet b)

  Compute the full rotation matrix of AO orbital space.

Variables

- double **dfxxx** [MAX_DF]

17.10.2 Detailed Description

Contains all the functionalities for the development of the Generalized One-Electroc Potentials (OEP's).

17.11 psi Namespace Reference

Psi4 package namespace.

Typedefs

- using **SharedBasisSet** = std::shared_ptr< BasisSet >
- using **SharedMolecule** = std::shared_ptr< Molecule >
- using **SharedMatrix** = std::shared_ptr< Matrix >
- using **SharedWavefunction** = std::shared_ptr< Wavefunction >

Functions

- PSI_API int read_options (std::string name, Options &options)

  Options for the OEPDev plugin.
- void **export_dmtp** (py::module &)

- • void **export_cphf** (py::module &)
- • void **export_solver** (py::module &)
- • void **export_util** (py::module &)
- • void **export_oep** (py::module &)
- • void **export_gefp** (py::module &)
- • PSI_API SharedWavefunction oepdev (SharedWavefunction ref_wfn, Options &options)

  Main routine of the OEPDev plugin.
- • **PYBIND11_MODULE** (oepdev, m)

17.11.1 Detailed Description

Contains all Psi4 functionalities.

17.11.2 Function Documentation

17.11.2.1 oepdev()

```
PSI_API SharedWavefunction psi::oepdev (
        SharedWavefunction ref_wfn,
        Options & options )
```

Created with intention to test various models of the interaction energy between two molecules, described by the Hartree-Fock-Roothaan-Hall theory or the configuration interaction with singles theory.

In particular, the plugin tests the models of:

1. the Pauli repulsion and CT interaction energy (Project II)

2. the Induction interaction energy (Project III)

3. the excitation energy transfer couplings (Project I)

against benchmarks (exact or reference solutions). The list of implemented models can be found in Implemented Models .

Parameters

ref_wfn	shared wavefunction of a dimer
options	psi::Options object

Returns

psi::SharedWavefunction (either ref_wfn or wavefunction union)

17.11.2.2 read_options()

```
PSI_API int psi::read_options (
          std::string name,
          Options & options )
```

Parameters

name	name of driver function
options	psi::Options object

Returns

true

Chapter 18

Class Documentation

18.1 oepdev::ABCD Struct Reference

Simple structure to hold the Fourier series expansion coefficients.

```
#include <unitary_optimizer.h>

- virtual std::shared_ptr< GenEffPar > compute (void)

  Compute the density matrix susceptibility tensors.

Additional Inherited Members

18.2.1   Detailed Description

Implements creation of the density matrix susceptibility tensors for which $\mathbf{X} = \mathbf{1}$. Guarantees the idempotency of the density matrix up to first-order in LCAO-MO variation. The density matrix susceptibility tensor is represented by:

$$\delta D_{\alpha\beta} = \sum_i \mathbf{B}_{\alpha\beta}^{(i;1)} \cdot \mathbf{F}(\mathbf{r}_i)$$

where $\mathbf{B}_{\alpha\beta}^{(i;1)}$ is the density matrix dipole polarizability defined for the distributed LMO site at $\mathbf{r}_i$. Its explicit form is given by

$$\mathbf{B}_{\alpha\beta}^{(i;1)} = C_{\alpha i}^{(0)} \mathbf{b}_{\beta}^{(i;1)} C_{\beta i}^{(0)} \mathbf{b}_{\alpha}^{(i;1)} - \sum_{\gamma} \left(D_{\alpha\gamma}^{(0)} C_{\beta i}^{(0)} + D_{\beta\gamma}^{(0)} C_{\alpha i}^{(0)} \right) \mathbf{b}_{\gamma}^{(i;1)}$$

where the susceptibility of the LCAO-MO coefficient is given by

$$b_{\alpha;w}^{(i;1)} = \frac{1}{4} \sum_u^{x,y,z} [\alpha_i]_{uw} \left[[\mathbf{L}_i]_{\mathrm{Left}}^{-1} \right]_{u;\alpha}$$

for $w = x, y, z$. The auxiliary tensor $\mathbb{L}$ is defined as

$$\mathbb{L} = \mathbf{C}^{(0)\mathrm{T}} \cdot \mathbb{M} \cdot \left(\mathbf{1} - \mathbf{D}^{(0)} \right)$$

where $\mathbb{M}$ is the dipole integral vector of matrices in AO representation. The left inverse of the i-th element is defined as

$$[\mathbf{L}_i]_{\mathrm{Left}}^{-1} \equiv \left[\mathbf{L}_i^{\mathrm{T}} \cdot \mathbf{L}_i \right]^{-1} \cdot \mathbf{L}_i^{\mathrm{T}}$$

Note that $\mathbf{L}_i \equiv [\mathbb{L}]_i$ is a $n \times 3$ matrix, whereas its left inverse is a $3 \times n$ matrix with n being the size of the AO basis set.

The documentation for this class was generated from the following files:

- oepdev/libgefp/gefp.h
- oepdev/libgefp/gefp_polar_abinitio.cc

18.3 oepdev::AllAOIntegralsIterator_2 Class Reference

Loop over all possible ERI within a particular shell doublet.

```
#include <integrals_iter.h>
```
Inheritance diagram for oepdev::AllAOIntegralsIterator_2:

Public Member Functions

- AllAOIntegralsIterator_2 (const ShellCombinationsIterator ∗shellIter)

    Construct by shell iterator (const object)

```
void AllAOShellCombinationsIterator_4::compute_shell (
            std::shared_ptr< oepdev::TwoBodyAOInt > tei ) const [virtual]
```

Compute integrals in a current shell. Works both for oepdev::TwoBodyAOInt and psi::TwoBodyAOInt

Parameters

tei	- two body integral object

Implements oepdev::ShellCombinationsIterator.

18.6.3.2 compute_shell() `[2/2]`

```
void oepdev::AllAOShellCombinationsIterator_4::compute_shell (
            std::shared_ptr< psi ::TwoBodyAOInt > tei ) const [virtual]
```

Compute integrals in a current shell. Works both for oepdev::TwoBodyAOInt and psi::TwoBodyAOInt

Parameters

tei	- two body integral object

Implements oepdev::ShellCombinationsIterator.

The documentation for this class was generated from the following files:

- oepdev/libutil/integrals_iter.h
- oepdev/libutil/integrals_iter.cc

18.7 oepdev::AOIntegralsIterator Class Reference

Iterator for AO Integrals. Abstract Base.

```
#include <integrals_iter.h>
```

Inheritance diagram for oepdev::AOIntegralsIterator:
Public Member Functions

- AOIntegralsIterator ()

    Base Constructor.
- virtual ∼AOIntegralsIterator ()

    Base Destructor.
- virtual void first (void)=0

    Do the first iteration.
- virtual void next (void)=0

    Do the next iteration.
- virtual int i (void) const

    Grab i-th index.
- virtual int j (void) const

    Grab j-th index.
- virtual int k (void) const

    Grab k-th index.
- virtual int l (void) const

    Grab l-th index.
- virtual int index (void) const =0

    Grab index in the integral buffer.
- virtual bool is_done (void)

    Returns the status of an iterator.

Static Public Member Functions

- static std::shared_ptr< AOIntegralsIterator > build (const ShellCombinationsIterator ∗shellIter, std::string mode="ALL")
- static std::shared_ptr< AOIntegralsIterator > build (std::shared_ptr< ShellCombinationsIterator > shellIter, std::string mode="ALL")

Protected Attributes

- bool done

    The status of an iterator.

18.7.1 Detailed Description

18.7.2 Member Function Documentation

18.7.2.1 build() [1/2]

```
std::shared_ptr< AOIntegralsIterator > AOIntegralsIterator::build (
        const ShellCombinationsIterator * shellIter,
        std::string mode = "ALL" ) [static]
```

Build AO integrals iterator from current state of iterator over shells

Parameters

shellIter	- iterator over shells - either "ALL" or "UNIQUE" (iterate over all or unique integrals)

Returns

iterator over AO integrals

18.7.2.2 build() [2/2]

```
std::shared_ptr< AOIntegralsIterator > AOIntegralsIterator::build (
        std::shared_ptr< ShellCombinationsIterator > shellIter,
        std::string mode = "ALL" ) [static]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

The documentation for this class was generated from the following files:

- oepdev/libutil/integrals_iter.h
- oepdev/libutil/integrals_iter.cc

18.8 oepdev::CAMM Class Reference

Cumulative Atomic Multipole Moments.

18.8.1   Detailed Description

Cumulative atomic multipole representation of the molecular charge distribution. Method of Sokalski and Poirier. Ref.: W. A. Sokalski and R. A. Poirier, *Chem. Phys. Lett.*, 98(1) **1983**

Methodology.

The distributed multipole moments are computed in the following way:

- first the atomic additive multipole moments (AAMM's) with origins set to the global coordinate system origin are computed. AO basis set partitioning is used to dostribute the AAMM's onto the atomic centres.

- subsequently, the AAMM's origins are moved to the corresponding atomic site.

The computation of the AAMM's is performed according to the following prescription:

$$M_{uw...z}^{(A)}(\mathbf{0}) = \sum_{\alpha \in A} \sum_{\beta \in \text{allAO's}} D_{\alpha\beta}^{\text{OED}} \langle \alpha | \mathscr{M}_{uw...z}(\mathbf{0}) | \beta \rangle$$

where $M_{uw...z}^{(A)}$ denotes the $(uw...z)$-th component of the multipole centered at atomic site A, the symbol $\mathscr{M}(\mathbf{0})$ is the associated quantum mechanical operator and $D_{\alpha\beta}^{\text{OED}}$ is the (generalized) one-particle density matrx element in AO basis (Greek indices).

Recentering of the multipole moments is described in the documentation of oepdev::DMTPole::recenter.

The documentation for this class was generated from the following files:

- oepdev/lib3d/dmtp.h
- oepdev/lib3d/dmtp_camm.cc

18.9.1 Detailed Description

Contains the following OEP types:

- `Otto-Ladik.V1.GDF` - DF-based term (group I)

- `Otto-Ladik.V3.CAMM-nj` - CAMM-based term (group III; truncated on distributed charges)

Group II terms do not require any particular OEP's due to great siplification of this term. Atomic numbers and LMO centroids are sufficient.

The documentation for this class was generated from the following files:

- oepdev/liboep/oep.h
- oepdev/liboep/oep_energy_ct.cc

18.10 oepdev::ChargeTransferEnergySolver Class Reference

Compute the Charge-Transfer interaction energy between unperturbed wavefunctions.

`#include <solver.h>`

Inheritance diagram for oepdev::ChargeTransferEnergySolver:
Public Member Functions

- **ChargeTransferEnergySolver** (SharedWavefunctionUnion wfn_union)
- virtual double compute_oep_based (const std::string &method="DEFAULT")

    Compute property by using OEP's.
- virtual double compute_benchmark (const std::string &method="DEFAULT")

    Compute property by using benchmark method.

Additional Inherited Members

18.10.1 Detailed Description

The implemented methods are shown below

Table 18.15: Methods available in the Solver

Keyword	Method Description	
	Benchmark Methods	
`OTTO_LADIK`	*Default*. CT energy at HF level from Otto and Ladik (1975).	
`EFP2`	CT energy at HF level from EFP2 model.	
	OEP-Based Methods	
`OTTO_LADIK`	*Default*. OEP-based Otto-Ladik expressions.	

In order to construct this solver, **always** use the `OEPDevSolver::build` static factory method.

Below the detailed description of the implemented equations is given for each of the above provided methods. In the formulae across, it is assumed that the orbitals are real. The Coulomb notation for electron repulsion integrals (ERI's) is adopted; i.e,

$$(ac|bd) = \iint d\mathbf{r}_1 d\mathbf{r}_2 \phi_a(\mathbf{r}_1)\phi_c(\mathbf{r}_1)\frac{1}{r_{12}}\phi_b(\mathbf{r}_2)\phi_d(\mathbf{r}_2)$$

Greek subscripts denote basis set orbitals whereas Italic subscripts denote the occupied molecular orbitals.

The CT energy between molecules *A* and *B* is given by

$$E^{\mathrm{CT}} = E^{\mathrm{A}^+\mathrm{B}^-} + E^{\mathrm{A}^-\mathrm{B}^+}$$

Benchmark Methods

CT energy at HF level by Otto and Ladik (1975).

For a closed-shell system, CT energy equation of Otto and Ladik becomes

$$E^{\mathrm{A}^+\mathrm{B}^-} \approx 2 \sum_{i\in A}^{\mathrm{Occ_A}} \sum_{n\in B}^{\mathrm{Vir_B}} \frac{V_{in}^2}{\varepsilon_i - \varepsilon_n}$$

where

$$
V_{in} = V_{in}^B + 2\sum_{j\in B}^{\mathrm{Occ_B}} (in|jj) - \sum_{k\in A}^{\mathrm{Occ_A}} S_{kn}\left\{ V_{ik}^B + 2\sum_{j\in B}^{\mathrm{Occ_B}} (ik|jj)\right\} \\
- \sum_{j\in B}^{\mathrm{Occ_B}} \left[S_{ij}\left\{ V_{nj}^A + 2\sum_{k\in A}^{\mathrm{Occ_A}} (1-\delta_{ik})(nj|kk)\right\} + (nj|ij)\right] + \sum_{k\in A}^{\mathrm{Occ_A}}\sum_{j\in B}^{\mathrm{Occ_B}} S_{kj}(1-\delta_{ik})(ik|nj)
$$

and analogously the twin term.

CT energy at HF level by EFP2.

In EFP2 method, CT energy is given as

$$E^{A^+B^-} \approx 2 \sum_{i \in A}^{Occ_A} \sum_{n \in B}^{Vir_B} \frac{V_{in}^2}{F_{ii} - T_{nn}}$$

where

$$V_{in}^2 = \frac{V_{in}^{EF,B} - \sum_{m \in A}^{All_A} V_{im}^{EF,B} S_{mn}^B}{1 - \sum_{m \in A}^{All_A} S_{mn}^2} \left\{ V_{in}^{EF,B} - \sum_{m \in A}^{All_A} V_{im}^{EF,B} S_{mn} + \sum_{j \in B}^{Occ_B} S_{ij} \left(T_{nj} - \sum_{m \in A}^{All_A} S_{nm} T_{mj} \right) \right\}$$

and analogously the twin term.

OEP-Based Methods

OEP-Based Otto-Ladik's theory

After introducing OEP's, the original Otto-Ladik's theory is reformulated *without* approximation as

$$E^{A^+B^-} \approx 2 \sum_{i \in A}^{Occ_A} \sum_{n \in B}^{Vir_B} \frac{\left(V_{in}^{DF} + V_{in}^{ESP,A} + V_{in}^{ESP,B} \right)^2}{\varepsilon_i - \varepsilon_n}$$

where

$$V_{in}^{DF} = \sum_{\eta \in B}^{Aux_B} S_{i\eta} G_{\eta n}^B$$

$$V_{in}^{ESP,A} = \sum_{k \in A}^{Occ_A} \sum_{j \in B}^{Occ_B} S_{kj} \sum_{x \in A} V_{nj}^{(x)} q_{ik}^{(x)}$$

$$V_{in}^{ESP,B} = - \sum_{k \in A}^{Occ_A} S_{kn} V_{ik}^B$$

The OEP matrix for density fitted part is given by

$$G_{\eta n}^B = \sum_{\eta' \in B}^{Aux_B} [\mathbf{S}^{-1}]_{\eta \eta'} \left\{ V_{\eta' n}^B + \sum_{j \in B}^{Occ_B} \left[2(\eta' n | jj) - (\eta' j | nj) \right] \right\}$$

The OEP ESP-A charges are fit to reproduce the OEP potential

$$v_{ik}^A(\mathbf{r}) \equiv (1 - \delta_{ik}) \int \frac{\phi_i(\mathbf{r}')\phi_k(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} d\mathbf{r}' - \delta_{ik} \left(\sum_{x \in A} \frac{-Z_x}{|\mathbf{r} - \mathbf{r}_x|} + 2 \sum_{k \in A}^{Occ_A} \int \frac{\phi_k(\mathbf{r}')\phi_k(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} d\mathbf{r}' - 2 \int \frac{\phi_i(\mathbf{r}')\phi_i(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} d\mathbf{r}' \right)$$

so that

$$v_{ik}^A(\mathbf{r}) \cong \sum_{x \in A} \frac{q_{ik}^{(x)}}{|\mathbf{r} - \mathbf{r}_x|}$$

The OEP ESP-B charges are fit to reproduce the electrostatic potential of molecule *B* (they are standard ESP charges).

18.10.2 Member Function Documentation

18.10.2.1 compute_benchmark()

```
double ChargeTransferEnergySolver::compute_benchmark (
          const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` benchmark method

Parameters

| *method* | - benchmark method |

Implements oepdev::OEPDevSolver.

18.10.2.2 compute_oep_based()

```
double ChargeTransferEnergySolver::compute_oep_based (
          const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` OEP-based method.

Parameters

| *method* | - flavour of OEP model |

Implements oepdev::OEPDevSolver.

18.12.1 Detailed Description

18.12.2 Member Function Documentation

18.12.2.1 build()

```
std::shared_ptr< CISComputer > oepdev::CISComputer::build (
            const std::string & type,
            std::shared_ptr< psi::Wavefunction > wfn,
            psi::Options & opt,
            const std::string & reference = "" ) [static]
```

Parameters

type	- Type of computer
wfn	- Psi4 wavefunction
opt	- Psi4 options
reference	- Reference Slater determinant (`RHF`, `UHF` available).

Available computer types:

- RESTRICTED or RCIS - RHF wavefunction is used as reference state

- UNRESTRICTED or UCIS - UHF wavefunction is used as reference state

Implementation

The CIS Hamiltonian in the basis space of singly-excited Slater determinants is constructed from canonical molecular orbitals (CMO's)

$$
\begin{aligned}
\left\langle \Phi_0 \middle| \mathscr{H} \middle| \Phi_i^a \right\rangle &= 0 \\
\left\langle \Phi_j^b \middle| \mathscr{H} \middle| \Phi_i^a \right\rangle &= \delta_{ij}\delta_{ab}\left(\varepsilon_a - \varepsilon_i\right) + \left\langle aj \middle| ib \right\rangle - \left\langle aj \middle| bi \right\rangle
\end{aligned}
$$

where *i* labels the occupied CMO's whereas *a* labels the virtual CMO's. In the above equation, $\left\langle aj \middle| ib \right\rangle$ is the 2-electron 4-centre integral in physicist's notation. After integrating out the spin coordinate, four blocks of Hamiltonian are explicitly given as

$$
\begin{aligned}
\left\langle \Phi_j^b \middle| \mathscr{H} \middle| \Phi_i^a \right\rangle &= \delta_{ij}\delta_{ab}\left(\varepsilon_a - \varepsilon_i\right) + \left[ia \middle| jb\right] - \left[ab \middle| ij\right] \\
\left\langle \Phi_{\bar{j}}^{\bar{b}} \middle| \mathscr{H} \middle| \Phi_{\bar{i}}^{\bar{a}} \right\rangle &= \delta_{\bar{i}\bar{j}}\delta_{\bar{a}\bar{b}}\left(\varepsilon_{\bar{a}} - \varepsilon_{\bar{i}}\right) + \left[\bar{i}\bar{a} \middle| \bar{j}\bar{b}\right] - \left[\bar{a}\bar{b} \middle| \bar{i}\bar{j}\right] \\
\left\langle \Phi_{\bar{j}}^{\bar{b}} \middle| \mathscr{H} \middle| \Phi_i^a \right\rangle &= \left[ia \middle| \bar{j}\bar{b}\right] \\
\left\langle \Phi_j^b \middle| \mathscr{H} \middle| \Phi_{\bar{i}}^{\bar{a}} \right\rangle &= \left[\bar{i}\bar{a} \middle| jb\right]
\end{aligned}
$$

where the $\left[ia \middle| jb\right]$ is the 2-electron 4-centre integral in the chemist's (Coulomb) notation.

Such matrix is diagonalized yelding the excitation energies (wrt HF ground state) as well as the CIS coefficients

$$
\sum_{ij}\sum_{ab} t_{i,I}^a H_{ij}^{ab} t_{j,J}^b = E_I \delta_{IJ}
$$

where the summations above extend over alpha and beta electron spin labels and $t_{i,I}^a$ is the CIS amplitude for the *I*th excited state, associated with the $i \rightarrow a$ excitation with respect to the HF reference determinant. Note that E_I is *not* the excited state energy, but the energy relative the the HF reference energy.

See also

For Davidson-Liu solution to CIS problem, see oepdev::R_CISComputer_DL and oepdev::U_CISComputer_DL.

Transition density matrix

AO basis transition density from ground (HF) to excited (CIS) state is given by

$$
P_{\mu\nu}^{(g \rightarrow e)} = \sum_i^{\text{Occ}} \sum_a^{\text{Vir}} t_{i,e}^a C_{\nu i} C_{\mu a} + \sum_{\bar{i}}^{\text{Occ}} \sum_{\bar{a}}^{\text{Vir}} t_{i,e}^{\bar{a}} C_{\nu \bar{i}} C_{\mu \bar{a}}
$$

Excited state density matrix

CMO basis excited state density matrix for alpha spin is given by

Analogous expression is given for the beta spin.

AO representation of the CMO excited state density matrix is

$$P_{\mu\nu}^{(e)} = \sum_{pq} C_{\mu p} P_{pq}^{(e)} C_{\nu q} + \sum_{\overline{pq}} C_{\mu\overline{p}} P_{\overline{pq}}^{(e)} C_{\nu\overline{q}}$$

which is the sum of alpha and beta density matrices in CMO basis transformed to AO basis.

The CMO excited state density matrix for spin alpha is given by

$$P_{pq}^{(e)} = \begin{cases} \delta_{pq} - \sum_a^{\text{Vir}} t_{p,e}^a t_{q,e}^a & \text{for p,q } \in \text{Occ} \\ \sum_i^{\text{Occ}} t_{i,e}^p t_{i,e}^q & \text{for p,q } \in \text{Vir} \\ 0 & \text{otherwise} \end{cases}$$

The beta spin density matrix is generated analogously as above.

The cumulative atomic multipole moments (CAMM) are computed from the excited state density matrices in AO basis. The nuclear contribution is included.

Transition multipole moments

The transition dipole moment is computed from the AO transition density matrix and the dipole integrals in AO basis, i.e.,

$$\left\langle \Phi_0 \middle| \hat{\mu}_u \middle| \Psi_e \right\rangle = \text{Tr} \left[\mathbf{d}^{(u)} \cdot \mathbf{P}^{g \to e} \right]$$

Oscillator strength is computed from the transition dipole moment via

$$f^{g \to e} = \frac{2}{3} E_e \left| \left\langle \Phi_0 \middle| \hat{\mu} \middle| \Psi_e \right\rangle \right|^2$$

Transition cumulative atomic multipole moments (TrCAMM) are computed from the transition density matrices in AO basis. The nuclear contribution is not included.

Spin angular momentum

The expectation value of the $\hat{S}^2$ operator is calculated from the CIS amplitudes and MOs of the reference wavefunction according to D. Maurice and M. Head-Gordon, *Int. J. Quant. Chem.*, **1995**, 95, 010361-10:

$$\left\langle \hat{S}^2 \right\rangle_{\text{UCIS}} = \left\langle \hat{S}^2 \right\rangle_{\text{UHF}} - \text{Tr} \left[\mathbf{Q}_{\text{Occ}}^{(\alpha)} \cdot \left\{ \mathbf{P}_{\text{Occ}}^{(e,\alpha)} - \mathbf{1} \right\} \right] - \text{Tr} \left[\mathbf{Q}_{\text{Occ}}^{(\beta)} \cdot \left\{ \mathbf{P}_{\text{Occ}}^{(e,\beta)} - \mathbf{1} \right\} \right]$$

$$- \text{Tr} \left[\mathbf{Q}_{\text{Vir}}^{(\alpha)} \cdot \mathbf{P}_{\text{Vir}}^{(e,\alpha)} \right] - \text{Tr} \left[\mathbf{Q}_{\text{Vir}}^{(\beta)} \cdot \mathbf{P}_{\text{Vir}}^{(e,\beta)} \right] - 2 \sum_i^{\text{Occ}} \sum_a^{\text{Vir}} \sum_{\overline{j}}^{\text{Occ}} \sum_{\overline{b}}^{\text{Vir}} \Delta_{i\overline{j}}^* \Delta_{a\overline{b}} t_{i,e}^a t_{\overline{j},e}^{\overline{b}}$$

where

$$[\mathbf{Q}_{\mathrm{Occ}}^{(\alpha)}]_{ij} = \sum_{\bar{k}}^{\mathrm{Occ}} \Delta_{\bar{k}i}^* \Delta_{\bar{k}j}$$

$$[\mathbf{Q}_{\mathrm{Occ}}^{(\beta)}]_{\bar{i}\bar{j}} = \sum_{k}^{\mathrm{Occ}} \Delta_{k\bar{i}}^* \Delta_{k\bar{j}}$$

$$[\mathbf{Q}_{\mathrm{Vir}}^{(\alpha)}]_{ab} = \sum_{\bar{k}}^{\mathrm{Occ}} \Delta_{\bar{k}a}^* \Delta_{\bar{k}b}$$

$$[\mathbf{Q}_{\mathrm{Vir}}^{(\beta)}]_{\bar{a}\bar{b}} = \sum_{k}^{\mathrm{Occ}} \Delta_{k\bar{a}}^* \Delta_{k\bar{b}}$$

and

$$\Delta_{pq} = \sum_{\mu\nu} C_{\mu p} S_{\mu\nu} C_{\nu p}$$

The diagnostic for UHF spin contamination is given by

$$\left\langle \hat{S}^2 \right\rangle_{\mathrm{UHF}} = \left\langle \hat{S}^2 \right\rangle_{\mathrm{exact}} + N_\beta - \sum_{i}^{\mathrm{Occ}} \sum_{\bar{j}}^{\mathrm{Occ}} |\Delta_{i\bar{j}}|^2$$

with

$$\left\langle \hat{S}^2 \right\rangle_{\mathrm{exact}} = \frac{N_\alpha - N_\beta}{2} \left(\frac{N_\alpha - N_\beta + 2}{2} \right)$$

and is also printed out to the output file.

Note

Useful options:

- `CIS_TYPE` - Algorithm of CIS. Available: `DAVIDSON_LIU` (Default), `DIRECT_EXPLICIT` (only RHF reference), `EXPLICIT`.

- `CIS_SCHWARTZ_CUTOFF` - Cutoff for Schwartz ERI screening. Default: 0.0. Relevant if `DAVIDSON_LIU` or `DIRECT_EXPLICIT` are chosen as CIS type.

- `CIS_STANDARDIZE_AMPLITUDES` - If true, CIS amplitudes of each excited state are rephased so that the leading amplitude is positive. Default: true.

- `OEPDEV_AMPLITUDE_PRINT_THRESHOLD` - Control threshold how many CIS amplitudes to print to the output. Default: 0.1.

- For UHF references, SAD guess might lead to triplet instabilities. It is then better to set `CORE` as the UHF guess

18.12.3 Member Data Documentation

18.12.3.1 nmo_

```
const int oepdev::CISComputer::nmo_ [protected]
```

Number of MO's

18.15 oepdev::CPHF Class Reference

CPHF solver class.

```
#include <cphf.h>
```

Public Member Functions

Constructor and Destructor

- CPHF (SharedWavefunction ref_wfn, Options &options)

  Constructor.
- ∼CPHF ()

  Desctructor.

Executor

- void compute (void)

  run the calculations

Printer

- void print (void) const

  print to output file

Accessors

- int nocc (void) const

  get the number of occupied orbitals
- std::shared_ptr< Wavefunction > wfn (void) const

  grab the wavefunction
- Options & options (void) const

  grab the Psi4 options
- std::shared_ptr< Matrix > polarizability (void) const

  retrieve the molecular (total) polarizability
- std::shared_ptr< Matrix > polarizability (int i) const

  retrieve the i-th orbital-associated polarizability
- std::shared_ptr< Matrix > polarizability (int i, int j) const

  retrieve the charge-transfer polarizability associated with orbitals i and j
- std::shared_ptr< Matrix > X (int x) const

  retrieve the X operator O-V perturbation matrix in AO basis for x-th component
- std::vector< std::shared_ptr< Matrix > > X (void) const

retrieve the X operator O-V perturbation matrix in AO basis for all three Cartesian components
- std::shared_ptr< Matrix > X_mo (int x) const

  retrieve the X operator O-V perturbation matrix in MO basis for x-th component
- std::vector< std::shared_ptr< Matrix > > X_mo (void) const

  retrieve the X operator O-V perturbation matrix in MO basis for all three Cartesian components
- std::shared_ptr< Matrix > F_mo (int x) const

  retrieve the F operator O-V perturbation matrix in MO basis for x-th component
- std::vector< std::shared_ptr< Matrix > > F_mo (void) const

  retrieve the F operator O-V perturbation matrix in MO basis for all three Cartesian components
- std::shared_ptr< Matrix > T (void) const

  retrieve the transformation from old to new MO's
- std::shared_ptr< Matrix > Cocc (void) const

  retrieve the Cocc (always Canonical)
- std::shared_ptr< Matrix > Cvir (void) const

  retrieve the Cvir
- std::shared_ptr< Vector > epsocc (void) const

  retrieve the epsocc (always Canonical)
- std::shared_ptr< Vector > epsvir (void) const

  retrieve the epsvir
- std::shared_ptr< Vector > lmo_centroid (int i) const

  retrieve the i-th orbital (LMO) centroid
- std::shared_ptr< Localizer > localizer (void) const

  retrieve the orbital localizer

Protected Attributes

Basic Data

- std::shared_ptr< psi::Wavefunction > _wfn

  Wavefunction object.
- Options & _options

  Options.
- std::shared_ptr< BasisSet > _primary

  Primary Basis Set.
- std::shared_ptr< Localizer > _localizer

  Orbital localizer.

Sizing Information

- const int _no

  Number of occupied orbitals.
- const int _nv

  Number of virtual orbitals.
- const int _nn

  Number of basis functions.

- long int _memory

    Memory.

Parameters of CPHF Calculations

- int _maxiter

    Maximum number of iterations.
- double _conv

    CPHF convergence threshold.
- bool _with_diis

    whether use DIIS or not
- const int _diis_dim

    Size of subspace.

Molecular Orbitals

- std::shared_ptr< Matrix > _cocc

    Occupied orbitals.
- std::shared_ptr< Matrix > _cvir

    Virtual orbitals.
- std::shared_ptr< Vector > _eps_occ

    Occupied orbital energies.
- std::shared_ptr< Vector > _eps_vir

    Virtual orbital energies.
- std::shared_ptr< psi::Matrix > _T

    Transformation from old to new MO's.

DIIS Manager

- std::vector< std::shared_ptr< oepdev::DIISManager > > _diis

    the DIIS managers for each perturbation operator x, y and z

Response Properties

- std::shared_ptr< Matrix > _molecularPolarizability

    Total (molecular) polarizability tensor.
- std::vector< std::shared_ptr< Vector > > _orbitalCentroids

    LMO centroids.
- std::vector< std::shared_ptr< Matrix > > _orbitalPolarizabilities

    orbital-associated polarizability tensors
- std::vector< std::vector< std::shared_ptr< Matrix > > > _orbitalChargeTransferPolarizabilities

    orbital-orbital charge-transfer polarizability tensors
- std::vector< std::shared_ptr< Matrix > > X_OV_ao_matrices

    Perturbation X Operator O->V matrices in AO basis.
- std::vector< std::shared_ptr< Matrix > > X_OV_mo_matrices

    Perturbation X Operator O->V matrices in MO basis.
- std::vector< std::shared_ptr< Matrix > > _F_OV_mo_matrices

    Electric Field Operator O->V matrices in MO basis.

18.15.1 Detailed Description

Solves CPHF equations (now only for RHF wavefunction). Computes molecular and polarizabilities associated with the localized molecular orbitals (LMO).

Note

Useful options:

- CPHF_CONVER - convergence of CPHF. Default: `1e-8` (au)
- CPHF_CONVER - maximum numberof iterations. Default: `50`
- CPHF_DIIS - wheather use DIIS or not. Default: `true`
- CPHF_DIIS_DIM - dimension of iterative subspace. Default: `3`
- CPHF_LOCALIZE - localize the molecular orbitals? Default: `true`
- CPHF_LOCALIZER - set orbital localization method. Available: `BOYS` and `PIPEK_MEZEY`. Default: `BOYS`

18.15.2 Constructor & Destructor Documentation

18.15.2.1 CPHF()

```
oepdev::CPHF::CPHF (
          SharedWavefunction ref_wfn,
          Options & options )
```

Parameters

ref_wfn	reference HF wavefunction
options	set of Psi4 options

The documentation for this class was generated from the following files:

- virtual void **davidson_liu_finalize**(bool)

Protected Attributes

- int N_davidson_liu_

    Dimensionality of Hamiltonian.

- int L_davidson_liu_

    Number of guess vectors.

- int M_davidson_liu_

    Number of roots of interest.

- psi::Options & options_

    Psi4 options.

- psi::SharedVector E_davidson_liu_

    Eigenvalues.

- psi::SharedMatrix U_davidson_liu_

    Eigenvectors.

- psi::SharedVector H_diag_davidson_liu_

    Diagonal elements of the matrix to diagonalize.

- psi::SharedVector E_old_davidson_liu_

    Old estimation of eigenvalues.

- bool davidson_liu_initialized_

    Is Davidson-Liu computer ready for calculations?

- bool davidson_liu_finalized_

    Is Davidson-Liu computer finished with calculations?

- int **davidson_liu_n_sigma_computed_**

- std::vector< psi::SharedVector > sigma_vectors_davidson_liu_

    Sigma vectors stored.

- std::shared_ptr< oepdev::GramSchmidt > guess_vectors_davidson_liu_

    Object storing guess vectors.

18.18.1 Detailed Description

Find the lowest *M* eigenvalues and associated eigenvectors of the real, symmetric (square) matrix **H**.

Associated options:

- `DAVIDSON_LIU_NROOTS` - number of roots of interest. Default: 1.

- `DAVIDSON_LIU_CONVER` - convergence of the iterative procedure as RMS of old and current eigenvalues. Default: 1.0E-10.

- `DAVIDSON_LIU_MAXITER` - maximum number of iterations. Default: 500.

- `DAVIDSON_LIU_GUESS` - Type of guess vectors. Default: `RANDOM`, which is constructing ranrom vectors.

- `DAVIDSON_LIU_THRESH_LARGE` - Small correction vector threshold (see description below). Default: 1.0E-03.

- `DAVIDSON_LIU_THRESH_SMALL` - Small correction vector threshold (see description below). Default: 1.0E-06.

- `DAVIDSON_LIU_SPACE_MAX` - Maximum number of guess vectors. Default: 200.

- `DAVIDSON_LIU_SPACE_START` - Starting amount of guess vectors. Must be larger or equal to number of roots. Default: -1, which means that number of roots is taken.

- `DAVIDSON_LIU_STOP_WHEN_UNCONVERGED` - Raise error when iterations do not converge. Default: True.

Usage in C++ programming

This class is an abstract base. In order to use the Davidson-Liu method fully implemented here, one must define a child class inheriting from oepdev::DavidsonLiu and implementing two of the pure methods:

- `davidson_liu_compute_diagonal_hamiltonian` - method specifying the calculation of the σ vectors, which are stored in the `std::vector<psi::SharedVector>` `sigma_vectors_davidson_liu_`;

- `davidson_liu_compute_diagonal_hamiltonian` - method specifying the calculation of the diagonal elements of the Hamiltonian, stored in the `psi::SharedVector` `H_diag_davidson_liu_`.

See also

Examples for demo use.

Implementation

The implementation follows Figure 5, Section 3.2.1 in Ref.[1]. Dimensionality:

- `N` - number of rows/collumns of matrix to diagonalize

- `L` - current number of guess vectors

- `M` - number of roots of interest

Sigma vectors are defined to be

$$\mathbf{S} = \mathbf{HB}$$

where **B** are the guess vectors stored as a matrix of size (N, L) in core memory. Subspace Hamiltonain is then given by

$$\mathbf{G} = \mathbf{B}^{\mathrm{T}}\mathbf{S}$$

and is diagonalized using standard diagonalization technique,

$$\mathbf{G} = \mathbf{U}\mathbf{z}\mathbf{U}^{\mathrm{T}}$$

where **z** are the eigenvalues. First *M* lowest eigenvalues and associated eigenvectors are saved in **E** and **A**, respectively (with the latter having size of (L, M)). The current eigenvector matrix **C** containing roots is given by

$$\mathbf{C} = \mathbf{B}\mathbf{A}$$

Once this step is completed, the correction vectors are computed for each eigenvalue according to

$$\delta_{Ik} = \frac{1}{E_k - H_{II}} \left[-E_k C_{Ik} + \sum_{l}^{L} \sigma_{Il} A_{lk} \right]$$

and they are orthonormalized against all the collumns of **B** by using the Gram-Schmidt procedure. If the norm of such orthonormalized correction vector is larger than threshold value, it is appended to **B** as new guess vector.

Note

> Note that the current implementation uses the original Davidson's preconditioner, which might have problems with breaking spin symmetry of the solution.

Treatment of correction vector threshold.

In the current implementation, two threshold values are defined:

- larger threshold, controlled by `DAVIDSON_LIU_THRESH_LARGE` Psi4 option, is used for the first lowest eigenvalue.

- smaller threshold, controlled by `DAVIDSON_LIU_THRESH_SMALL` Psi4 option, is used for the next eigenvalues if $M > 1$.

18.19.1 Detailed Description

```
    --------------------------------------------------------------------------------
                                    Electron Density

    Handles the Electron Density Distribution.

    --------------------------------------------------------------------------------

    Usage as container class:

     1) Initialize container object:

    density = Density(D = None, jk = None)

    where:
      o D  - the density matrix in AO or MO basis
      o jk - the psi4::JK object for AO basis JK calculations

     2) Grab the density matrix

    D = density.matrix()

     3) Computations in AO basis:

    o compute 1-electron energy (does not require JK object to be set)

       e_1 = density.compute_1el_energy(D, V1)

    The below require jk to be set:

    o compute 2-electron energy (J-type expression)

       e_2j = density.compute_2el_energy(D_left, D_right, type='j')
```

```
o compute 2-electron energy (K-type expression)

   e_2k = density.compute_2el_energy(D_left, D_right, type='k')

o compute J matrix (or K matrix if type=='k'):

   J = density.generalized_JK(D, type='j')

-------------------------------------------------------------------------------

Usage as method class.

Using 'Density' as a class of methods do not require object initialization.
The list of class methods is given below:

   o Density.natural_orbitals      - compute natural orbitals
   o Density.generalized_density  - compute generalized OPDM
   o Density.orthogonalize_OPDM   - compute orthogonalized OPDM
   o Density.orthogonalizer       - compute orthogonalizer matrix
   o Density.deorthogonalizer     - compute deorthogonalizer rmatrix

Usage:
   result = Density.'class method name'

See respective documentation for each of them for further details.

-------------------------------------------------------------------------------
                                                                    Last Revis
```

18.19.2 Member Function Documentation

18.19.2.1 natural_orbitals()

```
def gefp.density.opdm.Density.natural_orbitals (
         cls,
         D,
         S = None,
         C = None,
         orthogonalize_mo = True,
         order = 'descending',
         return_ao_orthogonal = False,
         renormalize = False,
         no_cutoff = False,
         ignore_large_n = False,
         n_eps = 5.0E-5 )

-------------------------------------------------------------------------------
Compute the Natural Orbitals from a given OPDM

-------------------------------------------------------------------------------
```

```
Usage:

n, c = Density.natural_orbitals(D, S = None, C = None,
                  orthogonalize_mo     = True,
                  order                = 'descending',
                  return_ao_orthogonal = False,
                  renormalize          = False,
                  no_cutoff            = False,
                  ignore_large_n       = False,
                  n_eps                = 5.0E-5)

where:
 o D - OPDM in AO or MO basis
 o S - overlap integrals in AO or MO basis
 o C - LCAO-MO transformation matrix
 o orthogonalize_mo     - whether to transform D from AO to certain MO basis and diagon
 o order                - order in which eigenvalues (occupancies) are sorted. Eigenval
 o return_ao_orthogonal - whether to return NO's in oAO basis set or not
 o renormalize          - renormalize to integer number of electrons
 o no_cutoff            - cut-off threshold for occupancies
 o ignore_large_n       - raise ValueError if (1.0 + n_eps) < n < (0.0 - n_eps)
 o n_eps                - tolerance for occupancy deviation

 ------------------------------------------------------------------------------

Examples:

 1) NO's in AO (non-orthogonal, original) basis from D in AO basis

    n, c = Density.natural_orbitals(D, S, C, orthogonalize_mo = True, n_eps = 0.001)

    D: ndarray of shape (AO x AO)
    S: ndarray of shape (AO x AO)
    C: ndarray of shape (AO x MO)

    --> transformation D (MO x MO) = C.T S D S C and its diagonalization
    --> transformation of transformation matrix from MO to AO basis

    n: ndarray of shape (NO)
    c: ndarray of shape (AO x NO)

 2) NO's in certain orthogonal MO basis from D in the same MO basis

    n, c = Density.natural_orbitals(D, None, None, orthogonalize_mo = False, n_eps = 0.

    D: ndarray of shape (MO x MO)

    --> diagonalization of D

    n: ndarray of shape (NO)
    c: ndarray of shape (MO x NO)

 ------------------------------------------------------------------------------
                                                          Last Revision: Gundelf

18.20.1 Detailed Description

```
--------------------------------------------------------------------------------

Density-Based Decomposition Scheme of Mandado and Hermida-Ramon
with partitioning of polarization deformation density into induction,
dispersion and charge-transfer contributions.

                   --> DDS <--
           --> Density Decomposition Scheme <--

References:
 * Mandado and Hermida-Ramon, J. Chem. Theory Comput. 2011, 7, 633-641. (JCTC 2011)
 * B_lasiak, J. Chem. Phys. 2018 149 (16), 164115. (JCP 2018)

--------------------------------------------------------------------------------

Constructor arguments and options:

 o aggregate - Psi4 molecular aggregate with at least two fragments
 o method    - QM method (hf, mp2, cc2, ccsd)
 o acbs      - use aggregate-centred basis set for calculations of wavefunctions.
           Otherwise use monomer-centred basis sets and composite Hadamard
           addition of AO spaces. ACBS=False result in no correction for BSSE.
```

```
  o jk_type  – type of Psi4 JK object.
  o no_cutoff – cutoff for natural occupancies threshold. All natural orbitals
             with occupancies less or equal to the threshold will be neglected.
  o xc_scale  – scaling parameter for exchange-correlation density
  o l_dds    – compute also linear DDS total interaction energy
  o kwargs   – additional Psi4-relevant options.
```

```
 -------------------------------------------------------------------------------
```

```
 Usage example:

   solver = DensityDecomposition(aggr, method='hf',
                                       acbs=True,
                                       jk_type='direct',
                                       no_cutoff=0.000,
                                       xc_scale=1.0,
                                       l_dds=True,
                                       n_eps=5.0E-5,
                                       cc_relax=True,
                                       verbose=True,
                                       **kwargs)
   solver.compute(polar_approx=False)

   dD_pauli = solver.deformation_density('pau')
   dD_pol   = solver.deformation_density('pol')
   dD       = solver.deformation_density('fqm')

   # dictionaries:
   # 1. accessing variables
   solver.vars
   # 2. accessing aggregate data
   solver.matrix
   # 3. accessing unperturbed fragment data (expert)
   solver.data

   print(solver)
   solver.print_out()
```

```
 -------------------------------------------------------------------------------
                                                        Created      : Gundelf
                                                        Last Revision: Gundelf
```

18.20.2 Member Function Documentation

18.20.2.1 compute()

```
def gefp.density.partitioning.DensityDecomposition.compute (
          self,
          polar_approx = True )
```

\

```
Perform the full density and interaction energy decompositions.

Options:
 o polar_approx - in addition to exact polarization energy, compute
   also the approximated polarization energy using
   NO-expansion of exchange-correlation 2-electron density
   and exact Pauli, polarization and unperturbed 1-electron densities.
   Default: True

Notes:
 o Exact polarization energy is always computed as a difference between
   the full QM interaction energy and all the remaining energies (Coulombic,
   exchange and repulsion energies).
```

18.20.2.2 deformation_density()

```
def gefp.density.partitioning.DensityDecomposition.deformation_density (
          self,
          name )
```

```
\
 Compute the deformation 1-particle density matrix.
 Returns density matrix in AO basis of entire molecular aggregate.

 Possible <name> entries:
  o fqm      - full QM deformation density
  o pau      - Pauli-repulsion denformation density
  o pol      - polarization deformation density
  o ind      - induction part of polarization deformation density
  o dis      - dispersion part of polarization deformation density
  o ct       - charge-transfer part of polarization deformation density
```

18.26.1 Detailed Description

```
    ----------------------------------------------------------------------------------
                            Density Fragment Interaction (DFI) Method
    ----------------------------------------------------------------------------------

 Demo for SCF-DFI method (closed shells).

 Usage:
dfi = DFI(fragment_1, fragment_2, [...])  # OR: dfi = DFI(fragments)
dfi.run(maxit=30, conv=1.0e-5, verbose_scf=False, conv_scf=1.0e-5, maxit_scf=100, damp_s

 Notes:
o fragmet_i is a psi4.core.Molecule wit one Psi4 Fragment
o fragments is a psi4.core Molecule with multiple Psi4 Fragments ('--' separator in inpu
o SCF of unperturbed molecule is solved by Psi4, while the subsequent SCF's in DFI itera
  by SCF class instances of this Demo.
    ----------------------------------------------------------------------------------
                                                                Last Revision: Gund
```

18.26.2 Member Function Documentation

18.26.2.1 run()

```
def gefp.density.dfi.DFI.run (
            self,
            maxit = 100,
```

```
        conv = 1.0e-5,
        verbose_scf = False,
        conv_scf = 1.0e-5,
        maxit_scf = 100,
        damp_scf = 0.14,
        ndamp_scf = 0 )
```

```
Runs DFI iterations
```

18.29 oepdev::DIISManager Class Reference

DIIS manager.

```
#include <diis.h>
```

Public Member Functions

- [DIISManager](#) (int dim, int na, int nb)
- ~[DIISManager](#) ()
    Destructor.
- void [put](#) (const std::shared_ptr< const Matrix > &error, const std::shared_ptr< const Matrix > &vector)
- void [compute](#) (void)
- void [update](#) (std::shared_ptr< Matrix > &other)

18.29.1 Detailed Description

Instance can interact directly with the process of solving vector quantities in iterative manner. One needs to pass the dimensions of solution vector as well as the DIIS subspace size. The iterative procedure requires providing the current vector and also an estimate of the error vector. The updated DIIS vector can be copied to an old vector through the Instance.

18.29.2 Constructor & Destructor Documentation

18.29.2.1 DIISManager()

```
oepdev::DIISManager::DIISManager (
        int dim,
        int na,
        int nb )
```

Constructor.

Parameters

dim	Size of DIIS subspace
na	Number of solution rows
nb	Number of solution columns

18.29.3 Member Function Documentation

18.29.3.1 compute()

```
void oepdev::DIISManager::compute (
          void  )
```

Perform DIIS interpolation.

18.29.3.2 put()

```
void oepdev::DIISManager::put (
          const std::shared_ptr< const Matrix > & error,
          const std::shared_ptr< const Matrix > & vector )
```

Put the current solution to the DIIS manager.

Parameters

error	Shared matrix with current solution error
vector	Shared matrix with current solution vector

18.29.3.3 update()

```
void oepdev::DIISManager::update (
          std::shared_ptr< Matrix > & other )
```

Update solution vector. Pass the Shared pointer to current solution. Then it will be overriden by the updated DIIS solution.

The documentation for this class was generated from the following files:

- oepdev/libutil/diis.h
- oepdev/libutil/diis.cc

18.30 oepdev::DMTPole Class Reference

Distributed Multipole Analysis Container and Computer. Abstract Base.

`#include <dmtp.h>`

Inheritance diagram for oepdev::DMTPole:
Public Member Functions

Accessors

- virtual bool has_charges () const

  Has distributed charges?
- virtual bool has_dipoles () const

  Has distributed dipoles?
- virtual bool has_quadrupoles () const

  Has distributed quadrupoles?
- virtual bool has_octupoles () const

  Has distributed octupoles?
- virtual bool has_hexadecapoles () const

  Has distributed hexadecapoles?
- virtual psi::SharedMatrix centres () const

  Get the positions of distribution centres.
- virtual psi::SharedMatrix origins () const

  Get the positions of distribution origins.
- virtual psi::SharedVector centre (int x) const

  Get the position of the $*x*$th distribution centre.
- virtual psi::SharedVector origin (int x) const

  Get the position of the $*x*$th distribution origin.
- virtual std::vector< psi::SharedMatrix > charges () const

  Get the distributed charges.
- virtual std::vector< psi::SharedMatrix > dipoles () const

  Get the distributed dipoles.
- virtual std::vector< psi::SharedMatrix > quadrupoles () const

  Get the distributed quadrupoles.
- virtual std::vector< psi::SharedMatrix > octupoles () const

  Get the distributed octupoles.
- virtual std::vector< psi::SharedMatrix > hexadecapoles () const

  Get the distributed hexadecapoles.

- virtual psi::SharedMatrix charges (int i) const

    Get the distributed charges for the ith distribution.
- virtual psi::SharedMatrix dipoles (int i) const

    Get the distributed dipoles for the ith distribution.
- virtual psi::SharedMatrix quadrupoles (int i) const

    Get the distributed quadrupoles for the ith distribution.
- virtual psi::SharedMatrix octupoles (int i) const

    Get the distributed octupoles for the ith distribution.
- virtual psi::SharedMatrix hexadecapoles (int i) const

    Get the distributed hexadecapoles for the ith distribution.
- virtual int n_sites () const

    Get the number of distributed sites.
- virtual int n_dmtp () const

    Get the number of distributions.

Mutators

- void set_charges (std::vector< psi::SharedMatrix > M)

    Set the distributed charges.
- void set_dipoles (std::vector< psi::SharedMatrix > M)

    Set the distributed dipoles.
- void set_quadrupoles (std::vector< psi::SharedMatrix > M)

    Set the distributed quadrupoles.
- void set_octupoles (std::vector< psi::SharedMatrix > M)

    Set the distributed octupoles.
- void set_hexadecapoles (std::vector< psi::SharedMatrix > M)

    Set the distributed hexadecapoles.
- void set_charges (psi::SharedMatrix M, int i)

    Set the distributed charges for the ith distribution.
- void set_dipoles (psi::SharedMatrix M, int i)

    Set the distributed dipoles for the ith distribution.
- void set_quadrupoles (psi::SharedMatrix M, int i)

    Set the distributed quadrupoles for the ith distribution.
- void set_octupoles (psi::SharedMatrix M, int i)

    Set the distributed octupoles for the ith distribution.
- void set_hexadecapoles (psi::SharedMatrix M, int i)

    Set the distributed hexadecapoles for the ith distribution.

Transformators

- virtual void recenter (psi::SharedMatrix new_origins)

    Change origins of the distributed multipole moments of all sets.
- void translate (psi::SharedVector transl)

    Translate the DMTP sets.
- void rotate (psi::SharedMatrix rotmat)

    Rotate the DMTP sets.
- double superimpose (psi::SharedMatrix ref_xyz, std::vector< int > suplist={})

Superimpose the DMTP sets.

Computers

- void compute (std::vector< psi::SharedMatrix > D, std::vector< bool > t)

  Compute DMTP's from the set of the one-particle density matrices.
- void compute (void)

  Compute ground state DMTP.
- std::shared_ptr< MultipoleConvergence > energy (std::shared_ptr< DMTPole > other, MultipoleConvergence::ConvergenceLevel max_clevel=MultipoleConvergence::R5)

  Evaluate the generalized interaction energy.
- std::shared_ptr< MultipoleConvergence > potential (const double &x, const double &y, const double &z, MultipoleConvergence::ConvergenceLevel max_clevel=MultipoleConvergence::R5)

  Evaluate the generalized potential at a given point.
- std::shared_ptr< MultipoleConvergence > field (const double &x, const double &y, const double &z, MultipoleConvergence::ConvergenceLevel max_clevel=MultipoleConvergence::R5)

  Evaluate the generalized field at a given point.

Printers

- virtual void print_header () const =0

  Print the header.
- void print () const

  Print the contents.

Static Public Member Functions

- static MultipoleConvergence::ConvergenceLevel determine_dmtp_convergence_level (const std::string &option)

Protected Member Functions

Protected Interface

- DMTPole (std::shared_ptr< psi::Wavefunction > wfn, int n)

  Construct an empty DMTP object from the wavefunction.
- virtual void compute (psi::SharedMatrix D, bool transition, int i)

  Compute DMTP's from the one-particle density matrix.
- void compute_integrals ()

  Compute multipole integrals.
- void compute_order ()

  Compute maximum order of the integrals.
- virtual void recenter (psi::SharedMatrix new_origins, int i)

  Change origins of the distributed multipole moments of ith set.
- virtual void allocate ()

  Initialize and allocate memory.
- virtual void copy_from (const DMTPole ∗)

  Deep-copy the matrix and DMTP data.

Protected Attributes

Basic

- std::string name_

    Name of the distribution method.
- psi::SharedMolecule mol_

    Molecule associated with this DMTP.
- psi::SharedWavefunction wfn_

    Wavefunction associated with this DMTP.
- psi::SharedBasisSet primary_

    Basis set (primary)
- std::vector< psi::SharedMatrix > mpInts_

    Multipole integrals.

Sizing

- int nDMTPs_

    Number of DMTP's.
- int nSites_

    Number of DMTP sites.
- int order_

    Maximum order of the multipole.

Descriptors

- bool hasCharges_

    Has distributed charges?
- bool hasDipoles_

    Has distributed dipoles?
- bool hasQuadrupoles_

    Has distributed quadrupoles?
- bool hasOctupoles_

    Has distributed octupoles?
- bool hasHexadecapoles_

    Has distributed hexadecapoles?

Geometry

- psi::SharedMatrix centres_

    DMTP centres.
- psi::SharedMatrix origins_

    DMTP origins.

Multipoles

- std::vector< psi::SharedMatrix > charges_

DMTP charges.

- std::vector< psi::SharedMatrix > dipoles_

  DMTP dipoles.
- std::vector< psi::SharedMatrix > quadrupoles_

  DMTP quadrupoles.
- std::vector< psi::SharedMatrix > octupoles_

  DMTP octupoles.
- std::vector< psi::SharedMatrix > hexadecapoles_

  DMTP hexadecapoles.

Friends

- class MultipoleConvergence

Constructors and Destructor

- static std::shared_ptr< DMTPole > build (const std::string &type, std::shared_ptr< psi::Wavefunction > wfn, int n=1)

  Build an empty DMTP object from the wavefunction.
- static std::shared_ptr< DMTPole > empty (std::string type)

  Build an empty DMTP object of no type.
- DMTPole (void)

  Construct an empty DMTP object of no type.
- DMTPole (const DMTPole ∗)

  Copy constructor.
- virtual std::shared_ptr< DMTPole > clone (void) const =0

  Make a deep copy (`wfn_, mol_,` and `primary_` are shallow-copied)
- virtual ∼DMTPole ()

  Destructor.

18.30.1 Detailed Description

Handles the distributed multipole expansions up to hexadecapoles. Distributed centres as well as DMTP origins are allowed to be located in arbitrary points in space. The object describes a set of N DMTP's, that can be generated by providing one-particle density matrices in AO basis. Nuclear contributions can be switched on or off separately for each DMTP within a set. The following operations on the DMTP sets are available through the API:

- translation

- rotation

- superimposition

- recentering the origins

- computing the generalized property from another DMTP set

See also

    MultipoleConvergence

18.30.2 Constructor & Destructor Documentation

18.30.2.1 DMTPole() [1/2]

```
oepdev::DMTPole::DMTPole (
        void  )
```

Do not use this constructor. Use the DMTPole::empty method.

18.30.2.2 DMTPole() [2/2]

```
oepdev::DMTPole::DMTPole (
        std::shared_ptr< psi::Wavefunction > wfn,
        int n )  [protected]
```

Parameters

wfn	- wavefunction
n	- number of DMTP sets

Do not use this constructor. Use the DMTPole::build method.

18.30.3 Member Function Documentation

18.30.3.1 build()

```
std::shared_ptr< DMTPole > oepdev::DMTPole::build (
        const std::string & type,
        std::shared_ptr< psi::Wavefunction > wfn,
        int n = 1 )  [static]
```

Parameters

type	- DMTP method. Available: CAMM.

Parameters

wfn	- wavefunction
n	- number of DMTP sets

Returns

DMTP distribution

18.30.3.2 compute() [1/2]

```
void oepdev::DMTPole::compute (
          std::vector< psi::SharedMatrix > D,
          std::vector< bool > t )
```

Parameters

D	- list of one-particle density matrices
t	- list of flags determining if density is of transition type or not

18.30.3.3 compute() [2/2]

```
void oepdev::DMTPole::compute (
          void  )
```

Compute DMTP's from the *sum* of the ground-state alpha and beta one-particle density matrices (t=false, i=0). Results in a usual DMTP analysis of a molecule's charge density distribution.

18.30.3.4 determine_dmtp_convergence_level()

MultipoleConvergence::ConvergenceLevel oepdev::DMTPole::determine_dmtp_convergence_level
(
          const std::string & *option*) [static]

Determine the CAMM convergence for a given global option

Parameters

option	- string for option

18.30.3.5 empty()

```
std::shared_ptr< DMTPole > oepdev::DMTPole::empty (
          std::string type ) [static]
```

Returns

Blank DMTP distribution with memory allocated by no data.

18.30.3.6 energy()

```
std::shared_ptr< MultipoleConvergence > oepdev::DMTPole::energy (
          std::shared_ptr< DMTPole > other,
          MultipoleConvergence::ConvergenceLevel max_clevel = MultipoleConvergence::R5
)
```

Parameters

other	- interacting DMTP distribution.
max_clevel	- maximum convergence level (see below).

Returns

The generalized interaction energy convergence (A.U. units)

The following convergence levels are available:

- `MultipoleConvergence::R1`: includes qq terms.

- `MultipoleConvergence::R2`: includes dq terms and above.

- `MultipoleConvergence::R3`: includes qQ, dd terms and above.

- `MultipoleConvergence::R4`: includes qO, dQ terms and above.

- `MultipoleConvergence::R5`: includes qH, dO, QQ terms and above.

18.30.3.7 field()

```
std::shared_ptr< MultipoleConvergence > oepdev::DMTPole::field (
          const double & x,
          const double & y,
          const double & z,
          MultipoleConvergence::ConvergenceLevel max_clevel = MultipoleConvergence::R5
)
```

Parameters

x	- location *x*-th Cartesian component
y	- location *y*-th Cartesian component
z	- location *z*-th Cartesian component
max_clevel	- maximum convergence level (see below).

Returns

> The generalized field convergence (A.U. units)

The following convergence levels are available:

- `MultipoleConvergence::R1`: includes qq terms.

- `MultipoleConvergence::R2`: includes dq terms and above.

- `MultipoleConvergence::R3`: includes qQ, dd terms and above.

- `MultipoleConvergence::R4`: includes qO, dQ terms and above.

- `MultipoleConvergence::R5`: includes qH, dO, QQ terms and above.

18.30.3.8 potential()

```
std::shared_ptr< MultipoleConvergence > oepdev::DMTPole::potential (
        const double & x,
        const double & y,
        const double & z,
        MultipoleConvergence::ConvergenceLevel max_clevel = MultipoleConvergence::R5
)
```

Parameters

x	- location *x*-th Cartesian component
y	- location *y*-th Cartesian component
z	- location *z*-th Cartesian component
max_clevel	- maximum convergence level (see below).

Returns

> The generalized potential convergence (A.U. units)

The following convergence levels are available:

- `MultipoleConvergence::R1`: includes qq terms.

- `MultipoleConvergence::R2`: includes dq terms and above.

- `MultipoleConvergence::R3`: includes qQ, dd terms and above.

- `MultipoleConvergence::R4`: includes qO, dQ terms and above.

- `MultipoleConvergence::R5`: includes qH, dO, QQ terms and above.

18.30.3.9   recenter()

```
void oepdev::DMTPole::recenter (
          psi::SharedMatrix new_origins ) [virtual]
```

Parameters

new_origins	- matrix with coordinates of the new origins $\{\mathbf{r}_{\text{new}}\}$.

Note

> The number of origins has to be equal to the number of distributed centres.

Recentering of the multipoles affects the distributed dipoles and higher moments. The moments are given as

$$q_{\text{new}} = q_{\text{old}}$$
$$\boldsymbol{\mu}_{\text{new}} = \boldsymbol{\mu}_{\text{old}} - q_{\text{old}}\Delta^{(1)}$$
$$\Theta_{\text{new}} = \Theta_{\text{old}} + q_{\text{old}}\Delta^{(2)} - \sum_{\mathscr{P}_2} \mathscr{P}_2 \left[(q_{\text{old}}\mathbf{r}_{\text{old}} + \boldsymbol{\mu}_{\text{old}}) \otimes \Delta^{(1)} \right]$$
$$\Omega_{\text{new}} = \Omega_{\text{old}} - q_{\text{old}}\Delta^{(3)} + \sum_{\mathscr{P}_3} \mathscr{P}_3 \left[(q_{\text{old}}\mathbf{r}_{\text{old}} + \boldsymbol{\mu}_{\text{old}}) \otimes \Delta^{(2)} \right] - \sum_{\mathscr{P}_6} \mathscr{P}_6 \left[(q_{\text{old}}\mathbf{r}_{\text{old}}^2 + \boldsymbol{\mu}_{\text{old}} \otimes \mathbf{r}_{\text{old}} + \Theta_{\text{old}}) \otimes \Delta^{(1)} \right]$$
$$\Xi_{\text{new}} = \Xi_{\text{old}} + q_{\text{old}}\Delta^{(4)} - \sum_{\mathscr{P}_3} \mathscr{P}_3 \left[(q_{\text{old}}\mathbf{r}_{\text{old}} + \boldsymbol{\mu}_{\text{old}}) \otimes \Delta^{(3)} \right] + \sum_{\mathscr{P}_3} \mathscr{P}_3 \left[(q_{\text{old}}\mathbf{r}_{\text{old}}^2 + \boldsymbol{\mu}_{\text{old}} \otimes \mathbf{r}_{\text{old}} + \Theta_{\text{old}}) \otimes \Delta^{(2)} \right] - \sum_{\mathscr{P}}$$

where

$$\Delta^{(1)} \equiv \mathbf{r}_{\text{new}} - \mathbf{r}_{\text{old}}$$
$$\Delta^{(2)} \equiv \mathbf{r}_{\text{new}}^2 - \mathbf{r}_{\text{old}}^2$$
$$\Delta^{(3)} \equiv \mathbf{r}_{\text{new}}^3 - \mathbf{r}_{\text{old}}^3$$
$$\Delta^{(4)} \equiv \mathbf{r}_{\text{new}}^4 - \mathbf{r}_{\text{old}}^4$$

In the above equations, the distributed centre label was omitted (redundant) as each distributed site of multipoles is independent of the others. TODO - Finish for octupoles and hexadecapoles! -> define the permutation operators!

18.30.3.10 rotate()

```
void oepdev::DMTPole::rotate (
          psi::SharedMatrix rotmat )
```

Parameters

rotmat	- Cartesian rotation matrix **r**

Centers and origins, as well as dipole, quadrupole, octupole and hexadecapole moments are transformed according to:

$$x_a^{(i)} \to \sum_{a'} x_{a'}^{(i)} r_{a'a}$$

$$o_a^{(i)} \to \sum_{a'} o_{a'}^{(i)} r_{a'a}$$

$$\mu_a^{(i)} \to \sum_{a'} \mu_{a'}^{(i)} r_{a'a}$$

$$\Theta_a^{(i)} \to \sum_{a'b'} \Theta_{a'b'}^{(i)} r_{a'a} r_{b'b}$$

$$\Omega_a^{(i)} \to \sum_{a'b'c'} \Omega_{a'b'c'}^{(i)} r_{a'a} r_{b'b} r_{c'c}$$

$$\Xi_a^{(i)} \to \sum_{a'b'c'd'} \Xi_{a'b'c'd'}^{(i)} r_{a'a} r_{b'b} r_{c'c} r_{d'd}$$

where the definition of $r_{a'a}$ is consistent with the Kabsch algorithm implemented in KabschSuperimposer.

> KabschSuperimposer

18.30.3.11 superimpose()

```
double oepdev::DMTPole::superimpose (
          psi::SharedMatrix ref_xyz,
          std::vector< int > suplist = {} )
```

Parameters

ref_xyz	- target geometry to superimpose
suplist	- superimposition list

Returns

the RMS of superimposition Kabsch algorithm is used for superimposition.

  Perform the generalized density fit.

Additional Inherited Members

18.31.1   Detailed Description

The density fitting map projects the OEP onto an arbitrary (not necessarily complete) auxiliary basis set space through application of the self energy minimization technique. The resulting three-electron repulsion integrals are computed by utilizing the resolution of identity in an intermediate, nearly-complete basis set space, hence performing an internal density fitting in nearly complete basis. Refer to density fitting specialized for OEP's for more details.

18.31.2   Determination of the OEP matrix

Coefficients $\mathbf{G}$ are computed by using the following relation

$$\mathbf{G} = \mathbf{A}^{-1} \cdot \mathbf{R} \cdot \mathbf{H}$$

where the intermediate projection matrix is given by

$$\mathbf{H} = \mathbf{S}^{-1} \cdot \mathbf{V}$$

In the above equations,

$$
\begin{aligned}
A_{\xi\xi'} &= (\xi||\xi') \\
R_{\xi\varepsilon} &= (\xi||\varepsilon) \\
S_{\varepsilon\varepsilon'} &= (\varepsilon|\varepsilon') \\
V^{\varepsilon i} &= (\varepsilon|\hat{v}i)
\end{aligned}
$$

The following labeling convention is used here:

- i denotes the arbitrary state vector

- ξ denotes the auxiliary basis set element

- ε denotes the intermediate (nearly complete) basis set element

In the above, | denotes the single integration over electron coordinate, i.e.,

$$(a|b) \equiv \int d\mathbf{r}\, \phi_a^*(\mathbf{r})\phi_b(\mathbf{r})$$

whereas || acts as shown below:

$$(a||b) \equiv \iint d\mathbf{r}' d\mathbf{r}'' \frac{\phi_a^*(\mathbf{r}')\phi_b(\mathbf{r}'')}{|\mathbf{r}' - \mathbf{r}''|}$$

The spatial form of the potential operator $\hat{v}$ can be expressed by

$$v(\mathbf{r}) \equiv \int d\mathbf{r}' \frac{\rho(\mathbf{r}')}{|\mathbf{r}' - \mathbf{r}|}$$

with $\rho(\mathbf{r})$ being the effective one-electron density associated with $\hat{v}$.

18.31.2.1 Theory behind the double GDF scheme

In order to perform the generalized density fitting in an incomplete auxiliary basis set, one must apply the following formula:

$$\mathbf{G} = \mathbf{A}^{-1} \cdot \mathbf{B}$$

where one encounters the need of evaluation of the following *three-electron integrals*

$$B_{\xi i} = (\xi||\hat{v}i) \equiv \iiint d\mathbf{r}' d\mathbf{r}'' d\mathbf{r}''' \phi_\xi^*(\mathbf{r}') \frac{1}{|\mathbf{r}' - \mathbf{r}''|} \rho(\mathbf{r}''') \frac{1}{|\mathbf{r}''' - \mathbf{r}''|} \phi_i(\mathbf{r}'')$$

Computation of all the necessary integrals of this kind is very costly and impractical for larger molecules. However, one can use the same trick that is a kernel of the OEP technique introduced in the OEPDev project, i.e., introduce the effective potential in order to get rid of one integration. This can be done by performing the generalized density fitting in the nearly complete intermediate basis

$$\hat{v}|i) \cong \sum_\varepsilon H_{\varepsilon i}|\varepsilon)$$

Note that this is done just for the sake of factorizing the triple integral and computing the OEP matrix for the incomplete auxiliary basis. Therefore, the intermediate basis set is used just for a while during density fitting and is no longer necessary later on. By inserting the above identity to the triple integral one can transform it into a sum of the two-electron integrals that are much easier to evaluate. This leads to equations given in the beginning of this section.

18.31.3 Member Function Documentation

18.31.3.1 compute()

```
std::shared_ptr< psi::Matrix > DoubleGeneralizedDensityFit::compute (

18.34.1 Detailed Description

The implemented methods are shown below

Table 18.32: Methods available in the Solver

Keyword	Method Description	
Benchmark Methods		
FUJIMOTO_TI_CIS	*Default*. EET Coupling by Fujimoto JPC 2012.	
OEP-Based Methods		
FUJIMOTO_TI_CIS	*Default*. OEP-based TI/CIS expressions.	

In order to construct this solver, **always** use the `OEPDevSolver::build` static factory method.

Below the detailed description of the implemented equations is given for each of the above provided methods. In the formulae across, it is assumed that the orbitals are real. The Coulomb notation for electron repulsion integrals (ERI's) is adopted; i.e,

$$(ac|bd) = \iint d\mathbf{r}_1 d\mathbf{r}_2 \phi_a(\mathbf{r}_1)\phi_c(\mathbf{r}_1)\frac{1}{r_{12}}\phi_b(\mathbf{r}_2)\phi_d(\mathbf{r}_2)$$

Greek subscripts denote basis set orbitals whereas Italic subscripts denote the occupied molecular orbitals.

Benchmark Methods

TI/CIS Method (Fujimoto JPC 2012).

In the simplest version of TI/CIS approach, the Hamiltonian of the molecular aggregate (dimer) is constructed from the CIS approximation and 4 basis functions constructed as follows:

$$\left|\Phi_1\right\rangle = \left|\Psi_A^{(e)} \otimes \Psi_B^{(g)}\right\rangle$$

$$\left|\Phi_2\right\rangle = \left|\Psi_A^{(g)} \otimes \Psi_B^{(e)}\right\rangle$$

$$\left|\Phi_3\right\rangle = \left|\Psi_A^{(+)} \otimes \Psi_B^{(-)}\right\rangle$$

$$\left|\Phi_4\right\rangle = \left|\Psi_A^{(-)} \otimes \Psi_B^{(+)}\right\rangle$$

where *g* and *e* superscripts denote the ground and excited state of a molecule, + and − label the cationic and anionic state, respectively, whereas $\left|\Psi_X \otimes \Psi_Y\right\rangle$ denotes the antisymmetrized Hartree product of the monomer wavefunctions. The associated diagonal Hamiltonian matrix elements can be defined as

$$\left\langle\Phi_1\middle|\mathscr{H}-E_0\middle|\Phi_1\right\rangle \equiv E_1 = E_{e\rightarrow g}^A + \sum_{\mu\nu\in A}\left(P_{\nu\mu}^{A(e)}-P_{\nu\mu}^{A(g)}\right)\times\left\{V_{\mu\nu}^{B(\text{nuc})}+\sum_{\lambda\sigma\in B}P_{\lambda\sigma}^{B(g)}\left[(\mu\nu|\sigma\lambda)-\frac{1}{2}(\mu\lambda|\sigma\nu)\right]\right\}$$

$$\left\langle\Phi_2\middle|\mathscr{H}-E_0\middle|\Phi_2\right\rangle \equiv E_2 = E_{e\rightarrow g}^B + \sum_{\mu\nu\in B}\left(P_{\nu\mu}^{B(e)}-P_{\nu\mu}^{B(g)}\right)\times\left\{V_{\mu\nu}^{A(\text{nuc})}+\sum_{\lambda\sigma\in A}P_{\lambda\sigma}^{A(g)}\left[(\mu\nu|\sigma\lambda)-\frac{1}{2}(\mu\lambda|\sigma\nu)\right]\right\}$$

$$\left\langle\Phi_3\middle|\mathscr{H}-E_0\middle|\Phi_3\right\rangle \equiv E_3 = -\varepsilon_H^A + \varepsilon_L^B - (H^A H^A | L^B L^B)$$

$$\left\langle\Phi_4\middle|\mathscr{H}-E_0\middle|\Phi_4\right\rangle \equiv E_4 = \varepsilon_L^A - \varepsilon_H^B - (L^A L^A | H^B H^B)$$

The associated off-diagonal Hamiltonian matrix elements can be defined as

$$\left\langle\Phi_1\middle|\mathscr{H}\middle|\Phi_2\right\rangle \equiv V^{\text{Coul}} + V^{\text{Exch}} + V^{\text{Ovrl}}$$

$$\left\langle\Phi_1\middle|\mathscr{H}\middle|\Phi_3\right\rangle \equiv V^{\text{ET1}}$$

$$\left\langle\Phi_2\middle|\mathscr{H}\middle|\Phi_4\right\rangle \equiv V^{\text{ET2}}$$

$$\left\langle\Phi_1\middle|\mathscr{H}\middle|\Phi_4\right\rangle \equiv V^{\text{HT1}}$$

$$\left\langle\Phi_2\middle|\mathscr{H}\middle|\Phi_3\right\rangle \equiv V^{\text{HT2}}$$

$$\left\langle\Phi_3\middle|\mathscr{H}\middle|\Phi_4\right\rangle \equiv V^{\text{CT}}$$

where the Forster-type Coulombic (Coul), Dexter-type exchange (Exch), remaining overlap correction (Ovrl), as well as the electron, hole and charge (ET, HT, CT) transfer contributions are

defined. The exchange-Coulomb coupling takes the form

$$
V^{\mathrm{Coul}} = \frac{V^{\mathrm{Coul},(0)}}{1 - S_{12}^2}
$$

$$
V^{\mathrm{Exch}} = \frac{V^{\mathrm{Exch},(0)}}{1 - S_{12}^2}
$$

$$
V^{\mathrm{Ovrl}} = -\frac{(E_1 + E_2)S_{12}}{2(1 - S_{12}^2)}
$$

The overlap-corrected ET, HT and CT matrix elements read

$$
V^{\mathrm{ET1}} = \left[1 - S_{13}^2\right]^{-1} \left\{ V^{\mathrm{ET1},(0)} - \frac{1}{2}(E_1 + E_2)S_{13} \right\}
$$

$$
V^{\mathrm{ET2}} = \left[1 - S_{24}^2\right]^{-1} \left\{ V^{\mathrm{ET2},(0)} - \frac{1}{2}(E_1 + E_2)S_{24} \right\}
$$

$$
V^{\mathrm{HT1}} = \left[1 - S_{14}^2\right]^{-1} \left\{ V^{\mathrm{HT1},(0)} - \frac{1}{2}(E_1 + E_2)S_{14} \right\}
$$

$$
V^{\mathrm{HT2}} = \left[1 - S_{23}^2\right]^{-1} \left\{ V^{\mathrm{HT2},(0)} - \frac{1}{2}(E_1 + E_2)S_{23} \right\}
$$

$$
V^{\mathrm{CT}} = \left[1 - S_{34}^2\right]^{-1} \left\{ V^{\mathrm{CT},(0)} - \frac{1}{2}(E_1 + E_2)S_{34} \right\}
$$

In the above equatons, the superscript (0) denotes that the matrix elements are not affected by the overlap between molecular wavefunctions, and are given by

$$
V^{\mathrm{Coul},(0)} = \sum_{\mu\nu\in A} \sum_{\lambda\sigma\in B} P_{\nu\mu}^{g\to e(A)} P_{\lambda\sigma}^{g\to e(B)} (\mu\nu|\sigma\lambda)
$$

$$
V^{\mathrm{Exch},(0)} = -\frac{1}{2} \sum_{\mu\nu\in A} \sum_{\lambda\sigma\in B} P_{\nu\mu}^{g\to e(A)} P_{\lambda\sigma}^{g\to e(B)} (\mu\lambda|\sigma\nu)
$$

$$
V^{\mathrm{ET1},(0)} = t_{H\to L}^A \left\{ \left(L^A|\mathscr{F}|L^B\right) + 2\left(L^A H^A|H^A L^B\right) - \left(L^A L^B|H^A H^A\right) \right\}
$$

$$
V^{\mathrm{ET2},(0)} = t_{H\to L}^B \left\{ \left(L^A|\mathscr{F}|L^B\right) + 2\left(L^A H^B|H^B L^B\right) - \left(L^A L^B|H^B H^B\right) \right\}
$$

$$
V^{\mathrm{HT1},(0)} = t_{H\to L}^A \left\{ -\left(H^A|\mathscr{F}|H^B\right) + 2\left(H^A L^A|L^A H^B\right) - \left(H^A H^B|L^A L^A\right) \right\}
$$

$$
V^{\mathrm{HT2},(0)} = t_{H\to L}^B \left\{ -\left(H^A|\mathscr{F}|H^B\right) + 2\left(H^A L^B|L^B H^B\right) - \left(H^A H^B|L^B L^B\right) \right\}
$$

$$
V^{\mathrm{CT},(0)} = 2\left(H^A L^B|L^A H^B\right) - \left(H^A H^B|L^A L^B\right)
$$

In the above, $\mathscr{F}$ is the Fock operator whereas H and L denote the HOMO and LUMO orbitals, respectively. The overlap integrals between the basis states are approximated by

$$S_{12} \equiv \left(\Phi_1 \middle| \Phi_2\right) \cong -\frac{1}{N_{el}^{AB}} \mathrm{Tr}\left[\mathbf{P}^{g \to e(A)} \mathbf{s}^{AB} \mathbf{P}^{g \to e(B)} \mathbf{s}^{BA}\right]$$

$$S_{13} \equiv \left(\Phi_1 \middle| \Phi_3\right) \cong -\frac{t_{H \to L}^A}{N_{el}^{AB}} S_{LL}^{AB}$$

$$S_{14} \equiv \left(\Phi_1 \middle| \Phi_4\right) \cong +\frac{t_{H \to L}^A}{N_{el}^{AB}} S_{HH}^{AB}$$

$$S_{24} \equiv \left(\Phi_2 \middle| \Phi_4\right) \cong -\frac{t_{H \to L}^B}{N_{el}^{AB}} S_{LL}^{AB}$$

$$S_{23} \equiv \left(\Phi_2 \middle| \Phi_3\right) \cong +\frac{t_{H \to L}^B}{N_{el}^{AB}} S_{HH}^{AB}$$

$$S_{34} \equiv \left(\Phi_3 \middle| \Phi_4\right) \cong -\frac{1}{N_{el}^{AB}} S_{HH}^{AB} S_{LL}^{AB}$$

where the overlap between molecular orbitals U and W is given by

$$S_{UW}^{AB} \equiv \mathbf{s}^{AB} : \mathbf{c}_U^A \otimes \mathbf{c}_W^B$$

and $\mathbf{s}^{AB}$ is the AO overlap matrix between molecule A and B atomic basis functions.

For a closed-shell system, the EET coupling constant for two electronic transitions can be given approximately by

$$V \approx V^{\mathrm{Direct}} + V^{\mathrm{Inirect}}$$

where the overlap-corrected direct and indirect coupling constants are

$$V^{\mathrm{Direct}} = V^{\mathrm{Coul}} + V^{\mathrm{Exch}} + V^{\mathrm{Ovrl}}$$

$$V^{\mathrm{Indirect}} = V^{\mathrm{TI}-2} + V^{\mathrm{TI}-3}$$

with

$$V^{\mathrm{TI}-2} = -\frac{V^{\mathrm{ET1}} V^{\mathrm{HT2}}}{E_3 - E_1} - \frac{V^{\mathrm{ET2}} V^{\mathrm{HT1}}}{E_4 - E_1}$$

$$V^{\mathrm{TI}-3} = \frac{V^{\mathrm{CT}} \left(V^{\mathrm{ET1}} V^{\mathrm{ET2}} + V^{\mathrm{HT1}} V^{\mathrm{HT2}}\right)}{(E_3 - E_1)(E_4 - E_1)}$$

Fock matrix in AB space

In the current implementation, Fock matrix in the AB space, that is necessary to evaluate ET and HT matrix elements, can be defined as

1. the AB block of full Hartree-Fock SCF Fock matrix for entire system;

2. the zeroth-order Fock matrix that is composed of monomer's unperturbed ground-state 1-particle density matrices.

In the latter case, the Fock matrix in AO representation is given by:

$$F_{\alpha\in A,\beta\in B}^{AB} \approx T_{\alpha\beta} + V_{\alpha\beta}^{A(\text{nuc})} + V_{\alpha\beta}^{B(\text{nuc})} + \sum_{\mu\nu\in A} P_{\nu\mu}^{A(g)} G_{\alpha\beta,\mu\nu} + \sum_{\sigma\lambda\in B} P_{\lambda\sigma}^{B(g)} G_{\alpha\beta,\sigma\lambda}$$

where

$$G_{\alpha\beta,\gamma\delta} \equiv (\alpha\beta|\gamma\delta) - \frac{1}{2}(\alpha\delta|\gamma\beta)$$

Mulliken approximated exchange-like contributions.

Exchange and CT contributions require ERI's of type (AB,AB). It is instructive to approximate these contributions in terms of the Coulomb-like ERI's for the sake of testing of OEP-based approximations which are given in the next Section.

Application of the Mullipen approximation

$$(ij|kl) \approx \frac{1}{4} S_{ij} S_{kl} \left[(ii|kk) + (jj|kk) + (ii|ll) + (jj|ll)\right]$$

results in the following approximations to the exchange-like terms

$$V^{\text{Exch},(0)} \approx -\frac{1}{8} \sum_{\mu\nu\in A} \sum_{\lambda\sigma\in B} P_{\nu\mu}^{g\to e(A)} P_{\lambda\sigma}^{g\to e(B)} S_{\mu\lambda} S_{\sigma\nu} \left[(\mu\mu|\sigma\sigma) + (\lambda\lambda|\nu\nu) + (\mu\mu|\nu\nu) + (\lambda\lambda|\sigma\sigma)\right]$$

$$V^{\text{CT},(0)} \approx \frac{1}{2} S_{HL}^{AB} S_{LH}^{AB} \left[r_{HL}^{A} + r_{HL}^{B} + \rho_{H}^{A} \odot \rho_{H}^{B} + \rho_{L}^{A} \odot \rho_{L}^{B}\right]$$
$$- \frac{1}{4} S_{HH}^{AB} S_{LL}^{AB} \left[r_{HL}^{A} + r_{HL}^{B} + \rho_{H}^{A} \odot \rho_{L}^{B} + \rho_{L}^{A} \odot \rho_{H}^{B}\right]$$

The former can be rewritten in a more convenient to implement formula:

$$V^{\text{Exch},(0)} \approx -\frac{1}{4} \sum_{\mu\in A} \sum_{\nu\in B} (\mu\mu|\sigma\sigma)[\mathbf{P}^{A}\mathbf{s}^{AB}]_{\mu\sigma}[\mathbf{P}^{B}\mathbf{s}^{BA}]_{\sigma\mu} - \frac{1}{8} \sum_{\mu\nu\in A} P_{\nu\mu}^{A}(\mu\mu|\nu\nu)[\mathbf{s}^{AB}\mathbf{P}^{B}\mathbf{s}^{BA}]_{\mu\nu} - \frac{1}{8} \sum_{\sigma\lambda\in B} P_{\lambda\sigma}^{B}(\lambda\lambda|\sigma\sigma)$$

In the CT term,

$$r_{HL}^{A} \equiv \rho_{H}^{A} \odot \rho_{L}^{A}$$
$$r_{HL}^{B} \equiv \rho_{H}^{B} \odot \rho_{L}^{B}$$

where the effective Coulombic interaction energies are defined by

$$\rho_{U}^{A} \odot \rho_{W}^{B} \equiv \left(U^{A}U^{A}|W^{A}W^{A}\right)$$

OEP-Based Methods

TODO

OEP-Based TI/CIS theory

After introducing OEP's, the original TI/CIS theory by Fujimoto is reformulated *without* approximation as TODO

18.34.2 Member Function Documentation

18.34.2.1 compute_benchmark()

```
double EETCouplingSolver::compute_benchmark (
          const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` benchmark method

Parameters

method	- benchmark method

Implements [oepdev::OEPDevSolver](#).

18.34.2.2 compute_oep_based()

```
double EETCouplingSolver::compute_oep_based (
          const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` OEP-based method.

Parameters

method	- flavour of OEP model

Implements [oepdev::OEPDevSolver](#).

The documentation for this class was generated from the following files:

18.38.1 Detailed Description

The implemented methods are shown in below

Table 18.35: Methods available in the Solver

Keyword	Method Description
	Benchmark Methods
AO_EXPANDED	*Default*. Exact Coulombic energy from atomic orbital expansions.
MO_EXPANDED	Exact Coulombic energy from molecular orbital expansions

Keyword	Method Description
	OEP-Based Methods
`ESP_SYMMETRIZED`	*Default*. Coulombic energy from ESP charges interacting with nuclei and electronic density. Symmetrized with respect to monomers.
CAMM	Coulombic energy from CAMM distributions.

Below the detailed description of the above methods is given.

Benchmark Methods

Exact Coulombic energy from atomic orbital expansions.

The Coulombic interaction energy is given by

$$E^{\text{Coul}} = E^{\text{Nuc}-\text{Nuc}} + E^{\text{Nuc}-\text{El}} + E^{\text{El}-\text{El}}$$

where the nuclear-nuclear repulsion energy is

$$E^{\text{Nuc}-\text{Nuc}} = \sum_{x \in A} \sum_{y \in B} \frac{Z_x Z_y}{|\mathbf{r}_x - \mathbf{r}_y|}$$

the nuclear-electronic attraction energy is

$$E^{\text{Nuc}-\text{El}} = \sum_{x \in A} \sum_{\lambda \sigma \in B} Z_x V^{(x)}_{\lambda \sigma} \left(D^{(\alpha)}_{\lambda \sigma} + D^{(\beta)}_{\lambda \sigma} \right) + \sum_{y \in B} \sum_{\mu \nu \in A} Z_y V^{(y)}_{\mu \nu} \left(D^{(\alpha)}_{\mu \nu} + D^{(\beta)}_{\mu \nu} \right)$$

and the electron-electron repulsion energy is

$$E^{\text{El}-\text{El}} = \sum_{\mu \nu \in A} \sum_{\lambda \sigma \in B} \left\{ D^{(\alpha)}_{\mu \nu} + D^{(\beta)}_{\mu \nu} \right\} \left\{ D^{(\alpha)}_{\lambda \sigma} + D^{(\beta)}_{\lambda \sigma} \right\} (\mu \nu | \lambda \sigma)$$

In the above equations,

$$V^{(x)}_{\lambda \sigma} \equiv \int \frac{\varphi^*_\lambda(\mathbf{r}) \varphi_\sigma(\mathbf{r})}{|\mathbf{r} - \mathbf{r}_x|} d\mathbf{r}$$

Exact Coulombic energy from molecular orbital expansion.

This approach is fully equivalent to the atomic orbital expansion shown above. For the closed shell case, the Coulombic interaction energy is given by

$$E^{\text{Coul}} = E^{\text{Nuc}-\text{Nuc}} + E^{\text{Nuc}-\text{El}} + E^{\text{El}-\text{El}}$$

where the nuclear-nuclear repulsion energy is

$$E^{\text{Nuc}-\text{Nuc}} = \sum_{x \in A} \sum_{y \in B} \frac{Z_x Z_y}{|\mathbf{r}_x - \mathbf{r}_y|}$$

the nuclear-electronic attraction energy is

$$E^{\text{Nuc}-\text{El}} = 2 \sum_{i \in A} \sum_{y \in B} V_{ii}^{(y)} + 2 \sum_{j \in B} \sum_{x \in A} V_{jj}^{(x)}$$

and the electron-electron repulsion energy is

$$E^{\text{El}-\text{El}} = 4 \sum_{i \in A} \sum_{j \in B} (ii|jj)$$

OEP-Based Methods

Coulombic energy from ESP charges interacting with nuclei and electronic density.

In this approach, nuclear and electronic density of either species is approximated by ESP charges. In order to achieve symmetric expression, the interaction is computed twice (ESP of A interacting with density matrix and nuclear charges of B and vice versa) and then divided by 2. Thus,

$$E^{\text{Coul}} \approx \frac{1}{2} \left[\sum_{x \in A} \sum_{y \in B} \frac{Z_x q_y}{|\mathbf{r}_x - \mathbf{r}_y|} + \sum_{y \in B} \sum_{\mu\nu \in A} q_y V_{\mu\nu}^{(y)} \left(D_{\mu\nu}^{(\alpha)} + D_{\mu\nu}^{(\beta)} \right) + \sum_{y \in B} \sum_{x \in A} \frac{q_x Z_y}{|\mathbf{r}_x - \mathbf{r}_y|} + \sum_{x \in A} \sum_{\lambda\sigma \in B} q_x V_{\lambda\sigma}^{(x)} \left(D_{\lambda\sigma}^{(\alpha)} + D_{\lambda\sigma}^{(\beta)} \right) \right.$$

If the basis set is large and the number of ESP centres $q_{x(y)}$ is sufficient, the sum of first two contributions equals the sum of the latter two contributions.

Notes:

- This solver also computes and prints the ESP-ESP point charge interaction energy,

$$E^{\text{Coul,ESP}} \approx \sum_{x \in A} \sum_{y \in B} \frac{q_x q_y}{|\mathbf{r}_x - \mathbf{r}_y|}$$

  for reference purposes.

- In order to construct this solver, **always** use the `OEPDevSolver::build` static factory method.

18.38.2 Member Function Documentation

18.38.2.1 compute_benchmark()

```
double ElectrostaticEnergySolver::compute_benchmark (
        const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` benchmark method

Parameters

method	- benchmark method

Implements oepdev::OEPDevSolver.

18.38.2.2 compute_oep_based()

```
double ElectrostaticEnergySolver::compute_oep_based (
          const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` OEP-based method.

Parameters

method	- flavour of OEP model

Implements oepdev::OEPDevSolver.

- virtual std::shared_ptr< psi::Vector > compute_xyz (const double &x, const double &y, const double &z)

Compute a value of 3D field at point (x, y, z)

- virtual void print () const

    Print information of the object to Psi4 output.

Additional Inherited Members

18.39.1   Detailed Description

Computes the electrostatic potential of a molecule directly from the wavefunction. The electrostatic potential $v(\mathbf{r})$ at point $\mathbf{r}$ is computed from the following formula:

$$v(\mathbf{r}) = v_{\mathrm{nuc}}(\mathbf{r}) + v_{\mathrm{el}}(\mathbf{r})$$

where the nuclear and electronic contributions are defined accordingly as

$$v_{\mathrm{nuc}}(\mathbf{r}) = \sum_x \frac{Z_x}{|\mathbf{r} - \mathbf{r}_x|}$$

$$v_{\mathrm{el}}(\mathbf{r}) = \sum_{\mu\nu} \left\{ D_{\mu\nu}^{(\alpha)} + D_{\mu\nu}^{(\beta)} \right\} V_{\nu\mu}(\mathbf{r})$$

In the above equations, Z_x denotes the charge of xth nucleus, $D_{\mu\nu}^{(\omega)}$ is the one-particle (relaxed) density matrix element in AO basis associated with the ω electron spin, and $V_{\mu\nu}(\mathbf{r})$ is the potential one-electron integral defined by

$$V_{\nu\mu}(\mathbf{r}) \equiv \int d\mathbf{r}' \varphi_\nu^*(\mathbf{r}') \frac{1}{|\mathbf{r} - \mathbf{r}'|} \varphi_\mu(\mathbf{r}')$$

```
Public Member Functions

- ERI_2_2 (const IntegralFactory ∗integral, int deriv=0, bool use_shell_pairs=false)

  Constructor. Use oepdev::IntegralFactory to generate this object.

- ∼ERI_2_2 ()

  Destructor.

Protected Member Functions

- size_t compute_quartet (int, int, int, int)

  Compute ERI's between 4 shells.

Protected Attributes

- double ∗ mdh_buffer_12_

  Buffer for McMurchie-Davidson-Hermite coefficents for binomial expansion (shells 1 and 2)

- double ∗ mdh_buffer_34_

  Buffer for McMurchie-Davidson-Hermite coefficents for binomial expansion (shells 3 and 4)

18.41.1 Detailed Description

ERI's are computed for a shell quartet (PQ|RS) and stored in the `target_full_` buffer, accessible through `buffer()` method:

$$\text{For each } (n_1, l_1, m_1) \in P :$$
$$\text{For each } (n_2, l_2, m_2) \in Q :$$
$$\text{For each } (n_3, l_3, m_3) \in R :$$
$$\text{For each } (n_4, l_4, m_4) \in S :$$
$$\text{ERI} = (AB|CD)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}]$$

For detailed description of the McMurchie-Davidson scheme, refer to The Integral Package Library.

18.41.2 Implementation

A set of ERI's in a shell is decontracted as

$$(AB|CD)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}] = \sum_{ijkl} c_i(\alpha_1) c_j(\alpha_2) c_k(\alpha_3) c_l(\alpha_4)(ij|kl)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}]$$

where the primitive ERI is given by

$$(ij|kl)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}] = E_{ij}(\alpha_1, \alpha_2) E_{kl}(\alpha_3, \alpha_4)$$
$$\times \sum_{N_1=0}^{n_1+n_2} \sum_{L_1=0}^{l_1+l_2} \sum_{M_1=0}^{m_1+m_2} \sum_{N_2=0}^{n_3+n_4} \sum_{L_2=0}^{l_3+l_4} \sum_{M_2=0}^{m_3+m_4} d_{N_1}^{n_1 n_2} d_{L_1}^{l_1 l_2} d_{M_1}^{m_1 m_2} d_{N_2}^{n_3 n_4} d_{L_2}^{l_3 l_4} d_{M_2}^{m_3 m_4} [N_1 L_1 M_1 | N_2 L_2 M_2]$$

In the above equation, the multiplicative constants are given as

$$E_{ij}(\alpha_1, \alpha_2) = \exp\left[-\frac{\alpha_1 \alpha_2}{\alpha_1 + \alpha_2}|\mathbf{A} - \mathbf{B}|^2\right]$$
$$E_{kl}(\alpha_3, \alpha_4) = \exp\left[-\frac{\alpha_3 \alpha_4}{\alpha_3 + \alpha_4}|\mathbf{C} - \mathbf{D}|^2\right]$$

The documentation for this class was generated from the following files:

$$
$$
\text{For each } (n_4, l_4, m_4) \in S :
$$
$$
\text{ERI} = (ABC|D)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}]
$$

For detailed description of the McMurchie-Davidson scheme, refer to The Integral Package Library.

18.42.2 Implementation

A set of ERI's in a shell is decontracted as

$$(ABC|D)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}] = \sum_{ijkl} c_i(\alpha_1) c_j(\alpha_2) c_k(\alpha_3) c_l(\alpha_4) (ijk|l)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}]$$

where the primitive ERI is given by

$$(ijk|l)[\{\alpha\}, \mathbf{n}, \mathbf{l}, \mathbf{m}] = E_{ijk}(\alpha_1, \alpha_2, \alpha_3)$$

$$\times \sum_{N_1=0}^{n_1+n_2+n_3} \sum_{L_1=0}^{l_1+l_2+l_3} \sum_{M_1=0}^{m_1+m_2+m_3} \sum_{N_2=0}^{n_4} \sum_{L_2=0}^{l_4} \sum_{M_2=0}^{m_4} d_{N_1}^{n_1 n_2 n_3} d_{L_1}^{l_1 l_2 l_3} d_{M_1}^{m_1 m_2 m_3} d_{N_2}^{n_4} d_{L_2}^{l_4} d_{M_2}^{m_4} [N_1 L_1 M_1 | N_2 L_2 M_2]$$

In the above equation, the multiplicative constants are given as

$$E_{ijk}(\alpha_1, \alpha_2, \alpha_3) = \exp\left[-\frac{\alpha_1 \alpha_2}{\alpha_1 + \alpha_2} |\mathbf{A} - \mathbf{B}|^2\right] \exp\left[-\frac{(\alpha_1 + \alpha_2)\alpha_3}{\alpha_1 + \alpha_2 + \alpha_3} |\mathbf{P} - \mathbf{C}|^2\right]$$

18.43 oepdev::ESPSolver Class Reference

Charges from Electrostatic Potential (ESP). A solver-type class.

```
#include <esp.h>
```

Public Member Functions

- ESPSolver (SharedField3D field)

    Construct from 3D vector field.
- ESPSolver (SharedField3D field, psi::SharedMatrix centres)

    Construct from 3D vector field.
- virtual ∼ESPSolver ()

    Destructor.
- virtual psi::SharedMatrix charges () const

    Get the (fit) charges.
- virtual psi::SharedMatrix centres () const

    Get the charge distribution centres.
- virtual void set_charge_sums (psi::SharedVector s)

    Set the charge sums Q_p.
- virtual void set_charge_sums (const double &s)

    Set the charge sums Q_p (equal to all fields)
- virtual void compute ()

    Perform fitting of effective charges.

Protected Attributes

- const int nCentres_

    Number of fit centres.
- const int nFields_

    Number of fields to fit.
- SharedField3D field_

    Scalar field.
- psi::SharedMatrix charges_

    Charges to be fit.
- psi::SharedMatrix centres_

    Centres, at which fit charges will reside.
- psi::SharedVector charge_sums_

    Vector of sums of partial charges.

18.43.1 Detailed Description

Solves the least-squares problem to fit the generalized charges $q_{m;p}$, that reproduce the reference generalized potential $v_p^{\mathrm{ref}}(\mathbf{r})$ supplied by the `Field3D` object:

$$\int d\mathbf{r}' \left[v_p^{\mathrm{ref}}(\mathbf{r}') - \sum_m \frac{q_{m;p}}{|\mathbf{r}' - \mathbf{r}_m|} \right]^2 \to \text{minimize}$$

The charges are subject to the following constraint:

$$\sum_m q_{m;p} = Q_p \text{ for all } p$$

Method description.

M generalized charges is found by solving the matrix equation

$$\begin{pmatrix} \mathbf{A} & 1 \\ 1 & 0 \end{pmatrix}^{-1} \cdot \begin{pmatrix} \mathbf{b}_p \\ Q_P \end{pmatrix} = \begin{pmatrix} \mathbf{q}_p \\ \lambda \end{pmatrix}$$

where the $\mathbf{A}$ matrix of dimension $(M+1) \times (M+1)$ and $\mathbf{b}_p$ vector or length $M+1$ are given as

$$A_{mn} = \sum_i \frac{1}{r_{im} r_{in}}$$

$$b_{m;p} = \sum_i \frac{v_p^{\mathrm{ref}}(\mathbf{r}_m)}{r_{im}}$$

In the above equation, summations run over all sample points, at which reference potential is known. The solution is stored in the $M \times N$ matrix, where N is the dimensionality of the 3D vector field (i.e., the number of potentials supplied, $p_{\max}$). As a default, $Q_p = 0$ for all potentials. This can be set by `oepdev::ESPSolver::set_charge_sums` method.

Note

Useful options:

- `ESP_PAD_SPHERE` - Padding spherical radius for random points selection. Default: `10.0` [A.U.]

- `ESP_NPOINTS_PER_ATOM` - Number of random points per atom in a molecule. Default: `1500`

- `ESP_VDW_RADIUS_C` - The vdW radius for carbon atom. Default: `3.0` [A.U.]

- `ESP_VDW_RADIUS_H` - The vdW radius for hydrogen atom. Default: `4.0` [A.U.]

- `ESP_VDW_RADIUS_N` - The vdW radius for nitrogen atom. Default: `2.4` [A.U.]

- `ESP_VDW_RADIUS_O` - The vdW radius for oxygen atom. Default: `5.6` [A.U.]

- `ESP_VDW_RADIUS_F` - The vdW radius for fluorium atom. Default: `2.3` [A.U.]

- `ESP_VDW_RADIUS_CL` - The vdW radius for chlorium atom. Default: `2.9` [A.U.]

18.43.2 Constructor & Destructor Documentation

18.43.2.1 ESPSolver() [1/2]

```
oepdev::ESPSolver::ESPSolver (
        SharedField3D field )
```

Assume that the centres are on atoms associated with the 3D vector field.

Parameters

field	- oepdev 3D vector field object

18.43.2.2 ESPSolver() [2/2]

```
oepdev::ESPSolver::ESPSolver (
        SharedField3D field,
        psi::SharedMatrix centres )
```

Solve ESP equations for a custom set of charge distribution centres.

Parameters

field	- oepdev 3D vector field object
centres	- matrix with coordinates of charge distribution centres

The documentation for this class was generated from the following files:

Public Member Functions

- **FFAbInitioPolarGEFactory** (std::shared_ptr< psi::Wavefunction > wfn, psi::Options &opt)
- virtual std::shared_ptr< GenEffPar > compute (void)

  Compute the density matrix susceptibility tensors.

Additional Inherited Members

18.44.1 Detailed Description

Implements creation of the density matrix susceptibility tensors. Does not guarantee the idempotency of the density matrix in LCAO-MO variation, but for weak electric fields the idempotency is to be expected up to first order. The density matrix susceptibility tensor is represented by:

$$\delta D_{\alpha\beta} = \mathbf{B}^{(1)}_{\alpha\beta} \cdot \mathbf{F} + \mathbf{B}^{(2)}_{\alpha\beta} : \mathbf{F} \otimes \mathbf{F}$$

where $\mathbf{B}^{(1)}_{\alpha\beta}$ is the density matrix dipole polarizability defined as

$$\mathbf{B}^{(1)}_{\alpha\beta} = \frac{\partial D_{\alpha\beta}}{\partial \mathbf{F}}\bigg|_{\mathbf{F}=\mathbf{0}}$$

whereas $\mathbf{B}^{(2)}_{\alpha\beta}$ is the density matrix dipole-dipole hyperpolarizability,

$$\mathbf{B}^{(2)}_{\alpha\beta} = \frac{1}{2} \frac{\partial^2 D_{\alpha\beta}}{\partial \mathbf{F} \otimes \partial \mathbf{F}}\bigg|_{\mathbf{F}=\mathbf{0}}$$

The first derivative is evaluated numerically from central finite-field 3-point formula,

$$f' = \frac{f(h) - f(-h)}{2h} + \mathfrak{O}(h^2)$$

where h is the differentiation step. Second derivatives are evaluated from the following formulae:

$$f_{uu} = \frac{f(h) + f(-h) - 2f(0)}{h^2} + \mathfrak{O}(h^2)$$

$$f_{uw} = \frac{f(h,h) + f(-h,-h) + 2f(0) - f(h,0) - f(-h,0) - f(0,h) - f(0,-h)}{2h^2} + \mathfrak{O}(h^2)$$

As long as the second-order susceptibility is considered, this susceptibility model works well for uniform weak, moderate and strong electric fields.

The documentation for this class was generated from the following files:

- oepdev/libgefp/gefp.h
- oepdev/libgefp/gefp_polar_ffabinitio.cc

18.45 oepdev::Field3D Class Reference

General Vector Dield in 3D Space. Abstract base.

```
#include <space3d.h>
```

Inheritance diagram for oepdev::Field3D:
Public Member Functions

- Field3D (const int &ndim, const int &np, const double &pad, psi::SharedWavefunction wfn, psi::Options &options)

  Construct potential on random grid by providing wavefunction. Excludes space within vdW volume.
- Field3D (const int &ndim, const int &nx, const int &ny, const int &nz, const double &px, const double &py, const double &pz, std::shared_ptr< psi::Wavefunction > wfn, psi::Options &options)

  Construct potential on cube grid by providing wavefunction.
- virtual ∼Field3D ()

  Destructor.
- virtual int npoints () const

  Get the number of points at which the 3D field is defined.

- virtual std::shared_ptr< PointsCollection3D > points_collection () const

  Get the collection of points.

- virtual std::shared_ptr< psi::Matrix > data () const

  Get the data matrix in a form { [x, y, z, f_1(x, y, z), f_2(x, y, z), ... , f_n(x, y, z)] } where n = ndim.

- virtual std::shared_ptr< psi::Wavefunction > wfn () const

  Get the wavefunction.

- virtual bool is_computed () const

  Get the information if data is already computed or not.

- int dimension () const

  Get the number of fields.

- virtual void compute ()

  Compute the 3D field in each point from the point collection.

- virtual std::shared_ptr< psi::Vector > compute_xyz (const double &x, const double &y, const double &z)=0

  Compute a value of 3D field at point (x, y, z)

- virtual void write_cube_file (const std::string &name)

  Write the cube file (only for Cube collections, otherwise does nothing)

- virtual void print () const =0

  Print information of the object to Psi4 output.

Static Public Member Functions

- static shared_ptr< Field3D > build (const std::string &type, const int &np, const double &pad, psi::SharedWavefunction wfn, psi::Options &options, const int &ndim=1)

  Build 3D field of random points. vdW volume is excluded.

- static shared_ptr< Field3D > build (const std::string &type, const int &nx, const int &ny, const int &nz, const double &px, const double &py, const double &pz, psi::SharedWavefunction wfn, psi::Options &options, const int &ndim=1)

  Build 3D field of points on a g09-cube grid.

Protected Attributes

- std::shared_ptr< PointsCollection3D > pointsCollection_

  Collection of points at which the 3D field is to be computed.

- std::shared_ptr< psi::Matrix > data_

  The data matrix in a form { [x, y, z, f_1(x, y, z), f_2(x, y, z), ..., f_n(x, y, z)] } where n = nDim_.

- std::shared_ptr< psi::Wavefunction > wfn_

  Wavefunction.

- psi::Matrix geom_

  Geometry of a molecule.

- std::shared_ptr< psi::IntegralFactory > fact_

Integral factory.

- std::shared_ptr< psi::Matrix > pot_

  Matrix of potential one-electron integrals.

- std::shared_ptr< psi::OneBodyAOInt > oneInt_

  One-electron integral shared pointer.

- std::shared_ptr< PotentialInt > potInt_

  One-electron potential shared pointer.

- std::shared_ptr< psi::BasisSet > primary_

  Basis set.

- int nbf_

  Number of basis functions.

- int nDim_

  Dimensionality of the 3D field (1: scalar field, 2>: vector field)

- bool isComputed_

  Has data already computed?

18.45.1 Detailed Description

Create vector field defined at points distributed randomly or as an ordered g09 cube-like collection. Currently implemented fields are:

- Electrostatic potential - computes electrostatic potential (requires wavefunction)

- Template of generic classes - compute custom vector fields (requires generic object that is able to compute the field in 3D space)

Note: Always create instances by using static factory methods `build`. The following types of 3D vector fields are currently implemented:

- `ELECTROSTATIC POTENTIAL`

18.45.2 Constructor & Destructor Documentation

18.45.2.1 Field3D()

```
oepdev::Field3D::Field3D (
        const int & ndim,
        const int & nx,
        const int & ny,
        const int & nz,
        const double & px,
```

```
        const double & py,
        const double & pz,
        std::shared_ptr< psi::Wavefunction > wfn,
        psi::Options & options )
```

Construct potential on random grid by providing molecule. Excludes space within vdW volume Field3D(const int& ndim, const int& np, const double& pad, psi::SharedMolecule mol, psi::Options& options);

18.45.3 Member Function Documentation

18.45.3.1 build() [1/2]

```
std::shared_ptr< Field3D > oepdev::Field3D::build (
        const std::string & type,
        const int & np,
        const double & pad,
        psi::SharedWavefunction wfn,
        psi::Options & options,
        const int & ndim = 1 ) [static]
```

Parameters

ndim	- dimensionality of 3D field (1: scalar field, $>$2: vector field)
type	- type of 3D field
np	- number of points
pad	- radius padding of a minimal sphere enclosing the molecule
wfn	- Psi4 Wavefunction containing the molecule
options	- Psi4 options

18.45.3.2 build() [2/2]

```
std::shared_ptr< Field3D > oepdev::Field3D::build (
        const std::string & type,
        const int & nx,
        const int & ny,
        const int & nz,
        const double & px,
        const double & py,
        const double & pz,
        psi::SharedWavefunction wfn,
        psi::Options & options,
```

```
        const int & ndim = 1 ) [static]
```

Parameters

ndim	- dimensionality of 3D field (1: scalar field, >2: vector field)
type	- type of 3D field
nx	- number of points along x direction
ny	- number of points along y direction
nz	- number of points along z direction
px	- padding distance along x direction
py	- padding distance along y direction
pz	- padding distance along z direction
wfn	- Psi4 Wavefunction containing the molecule
options	- Psi4 options

18.48 oepdev::FragmentedSystem Class Reference

Molecular System for Fragment-Based Calculations.

```
#include <gefp.h>
```

Public Member Functions

Mutators

- void set_geometry (std::vector< psi::SharedMolecule > aggregate)

  Set the current atomic coordinates of the system.
- void set_primary (std::vector< psi::SharedBasisSet > p)

  Set the current atomic coordinates of the system.
- void set_auxiliary (std::vector< psi::SharedBasisSet > a)

  Set the auxiliary basis sets (TO BE DEPRECATED)

Transformators

- void superimpose ()

  Superimpose all the fragments onto the current atomic coordinates.

Computers

- double compute_energy (std::string theory)

    Compute a total energy.
- double compute_energy_term (std::string theory, bool manybody)

    Compute a single energy term.

Protected Attributes

Working Attributes

- std::vector< std::shared_ptr< GenEffFrag > > bsm_

    List of Base Fragments (BSMs)
- std::vector< int > ind_

    List of fragment assignment indices.
- const int nfrag_

    Number of all fragments in the system.
- std::vector< std::shared_ptr< GenEffFrag > > fragments_

    List of all fragments in the system.
- std::vector< psi::SharedMolecule > aggregate_

    List of molecules currently representing all fragments in the system.
- std::vector< psi::SharedBasisSet > basis_prim_

    List of current primary basis sets (TO BE DEPRECATED)
- std::vector< psi::SharedBasisSet > basis_aux_

Constructors and Destructor.

- static std::shared_ptr< FragmentedSystem > build (std::vector< std::shared_ptr< Gen-EffFrag >> bsm, std::vector< int > ind)

    Build from the list of base molecules (BSM) and fragment assignment vector.
- FragmentedSystem (std::vector< std::shared_ptr< GenEffFrag >> bsm, std::vector< int > ind)

    Constructor.
- virtual ∼FragmentedSystem ()

    Destructor.

18.48.1 Detailed Description

Implements interface of running fragment-based calculations on molecular systems defined in terms of independent but interacting fragments.

18.48.2 Member Function Documentation

18.48.2.1 build()

oepdev::SharedFragmentedSystem oepdev::FragmentedSystem::build (

          std::vector< std::shared_ptr< GenEffFrag >> *bsm,*

          std::vector< int > *ind*) [static]

Parameters

bsm	- list of base molecules
ind	- list of fragment assignments indices

Returns

> system of fragments

After initialization, the list of fragments f_i is created within the object, where the *i*-th fragment is given by

$$f_i = \text{copy}(m_{d_i})$$

In the above, *m* and *d* denote the lists of BSMs and fragment assignment indices, respectively.

18.48.2.2 compute_energy()

double oepdev::FragmentedSystem::compute_energy (

          std::string *theory*)

Parameters

theory	- theory to use for calculations

Returns

> energy in a.u.

18.48.2.3 compute_energy_term()

double oepdev::FragmentedSystem::compute_energy_term (

          std::string *theory,*

          bool *manybody*)

Parameters

theory	- theory to use for calculations
manybody	- whether to use many body routines.

Returns

> energy in a.u.

18.48.2.4 set_auxiliary()

```
void oepdev::FragmentedSystem::set_auxiliary (
          std::vector< psi::SharedBasisSet > a ) [inline]
```

Parameters

a	- list of all auxiliary basis sets in the system

Note

> This will be deprecated once basis sets can be rotated and embedded in oepdev::GenEffFrag.

18.48.2.5 set_geometry()

```
void oepdev::FragmentedSystem::set_geometry (
          std::vector< psi::SharedMolecule > aggregate ) [inline]
```

Parameters

aggregate	- list of all molecules in the system

18.48.2.6 set_primary()

```
void oepdev::FragmentedSystem::set_primary (
          std::vector< psi::SharedBasisSet > p ) [inline]
```

Parameters

aggregate	- molecule object of the whole systemSet the current atomic coordinates of the system.
aggregate	- molecule object of the whole systemSet the primary basis sets (TO BE DEPRECATED)
p	- list of all primary basis sets in the system

Note

> This will be deprecated once basis sets can be rotated and embedded in oepdev::GenEffFrag.

The documentation for this class was generated from the following files:

- oepdev/libgefp/gefp.h
- oepdev/libgefp/fragmented_system.cc

18.49 oepdev::GenEffFrag Class Reference

Generalized Effective Fragment. Container Class.

```
#include <gefp.h>
```

Inheritance diagram for oepdev::GenEffFrag:
Public Member Functions

Transformators

- void rotate (std::shared_ptr< psi::Matrix > R)

  Rotate.
- void translate (std::shared_ptr< psi::Vector > T)

  Translate.
- void superimpose (std::shared_ptr< psi::Matrix > targetXYZ, std::vector< int > supList)

  Superimpose.
- void superimpose (psi::SharedMolecule targetMol, std::vector< int > supList)

  Superimpose.
- void superimpose (void)

  Superimpose to the structure held in `frag_`

Mutators

- void set_parameters (const std::string &type, std::shared_ptr< GenEffPar > par)

  Set the parameters.
- void set_ndocc (int n)

  Set the number of doubly occupied MOs.
- void set_nbf (int n)

  Set the number of primary basis functions.
- void set_molecule (const psi::SharedMolecule mol)

Set the fragment molecule.
- void set_basisset (std::string key, psi::SharedBasisSet basis)

    Set the basis set.
- void set_gefp_polarization (const std::shared_ptr< GenEffPar > &par)

    Set the Density Matrix Susceptibility Tensor Object.
- void set_dmat_dipole_polarizability (const std::vector< std::vector< std::shared_ptr< psi::Matrix >>> &susc)

    Set the Density Matrix Dipole Polarizability.
- void set_dmat_dipole_dipole_hyperpolarizability (const std::vector< std::vector< std::shared_ptr< psi::Matrix >>> &susc)

    Set the Density Matrix Dipole-Dipole Hyperpolarizability.
- void set_dmat_quadrupole_polarizability (const std::vector< std::vector< std::shared_ptr< psi::Matrix >>> &susc)

    Set the Density Matrix Quadrupole Polarizability.

Accessors

- int nbf (void) const

    Grab the number of primary basis functions.
- int natom (void) const

    Grab the number of atoms.
- int ndocc (void) const

    Grab the number of doubly occupied molecular orbitals.
- psi::SharedMolecule molecule (void) const

    Grab the molecule attached to this fragment.
- std::shared_ptr< psi::Matrix > susceptibility (int fieldRank, int fieldGradientRank, int i, int x) const

    Grab the Density Matrix Susceptibility.
- std::vector< std::shared_ptr< psi::Matrix > > susceptibility (int fieldRank, int fieldGradientRank, int i) const

    Grab the Density Matrix Susceptibility.
- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > susceptibility (int fieldRank, int fieldGradientRank) const

    Grab the Density Matrix Susceptibility.

Public Attributes

Parameters

    Create an empty fragment.

Computers

- double energy_term (std::string theory, std::shared_ptr< GenEffFrag > other) const

    Compute interaction energy between this and other fragment.

- static double compute_energy (std::string theory, std::vector< std::shared_ptr< GenEff-Frag >> fragments)

    Compute the total interaction energy term in a cluster of fragments.

- static double compute_energy_term (std::string theory, std::vector< std::shared_ptr< Gen-EffFrag >> fragments, bool manybody)

    Compute a single interaction energy term in a cluster of fragments.

- static double compute_many_body_energy_term (std::string theory, std::vector< std::shared_ptr< GenEffFrag >> fragments)

    Compute a single interaction energy term in a cluster of fragments by using manybody routine.

18.49.1 Detailed Description

Describes the GEFP fragment that is in principle designed to work at correlated levels of theory.

GenEffPar, GenEffParFactory

18.49.2 Member Function Documentation

18.49.2.1 compute_energy()

```
double oepdev::GenEffFrag::compute_energy (
        std::string theory,
        std::vector< std::shared_ptr< GenEffFrag >> fragments ) [static]
```

Parameters

theory	- theory used to compute energy
fragments	- list of fragments in the system

Returns

interaction energy in [A.U.]

18.49.2.2 compute_energy_term()

```
double oepdev::GenEffFrag::compute_energy_term (
        std::string theory,
        std::vector< std::shared_ptr< GenEffFrag >> fragments,
        bool manybody ) [static]
```

Parameters

theory	- theory used to compute energy
fragments	- list of fragments in the system
manybody	- use the manybody routine? If not, pairwise routine is utilized.

Returns

interaction energy in [A.U.]

18.49.2.3 compute_many_body_energy_term()

```
double oepdev::GenEffFrag::compute_many_body_energy_term (
        std::string theory,
        std::vector< std::shared_ptr< GenEffFrag >> fragments ) [static]
```

Parameters

theory	- theory used to compute energy
fragments	- list of fragments in the system

Returns

interaction energy in [A.U.]

18.49.2.4 energy_term()

```
double oepdev::GenEffFrag::energy_term (
        std::string theory,
        std::shared_ptr< GenEffFrag > other ) const
```

Parameters

theory	- theory used to compute energy
other	- other fragment

Returns

interaction energy in [A.U.]

18.49.2.5 susceptibility() [1/3]

```
std::shared_ptr<psi::Matrix> oepdev::GenEffFrag::susceptibility (
        int fieldRank,
        int fieldGradientRank,
        int i,
        int x ) const [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field
fieldGradientRank	- power dependency with respect to the electric field gradient
i	- id of the distributed site
x	- id of the composite Cartesian component

18.49.2.6 susceptibility() [2/3]

```
std::vector<std::shared_ptr<psi::Matrix> > oepdev::GenEffFrag::susceptibility
(
            int fieldRank,
            int fieldGradientRank,
            int i ) const [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field
fieldGradientRank	- power dependency with respect to the electric field gradient
i	- id of the distributed site

18.49.2.7 susceptibility() [3/3]

```
std::vector<std::vector<std::shared_ptr<psi::Matrix> > > oepdev::GenEffFrag::susceptib:
(
            int fieldRank,
            int fieldGradientRank ) const [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field
fieldGradientRank	- power dependency with respect to the electric field gradient

The documentation for this class was generated from the following files:

18.50 oepdev::GenEffPar Class Reference

Generalized Effective Fragment Parameters. Container Class.

```
#include <gefp.h>
```

Public Member Functions

Transformators

- void rotate (psi::SharedMatrix R)

  Rotate the parameters in 3D Euclidean space.

- void [translate](psi::SharedVector t)
  Translate the parameters in 3D Euclidean space.
- void [superimpose](psi::SharedMatrix targetXYZ, std::vector< int > supList)
  Superimpose the parameters in 3D Euclidean space onto a target geometry.

Mutators

- void [set_vector](std::string key, psi::SharedVector mat)
  Set the vector data.
- void [set_matrix](std::string key, psi::SharedMatrix mat)
  Set the matrix data.
- void [set_dmtp](std::string key, std::shared_ptr< [oepdev::DMTPole](#) > mat)
  Set the DMTP data.
- void [set_oep](std::string key, oepdev::SharedOEPotential [oep](#))
  Set the OEP data.
- void [set_dpol](std::string key, std::vector< psi::SharedMatrix > mats)
  Set the DPOL data.
- void [set_basisset](std::string key, psi::SharedBasisSet basis)
  Set the basis set data.
- void [set_susceptibility](#) (int fieldRank, int fieldGradientRank, const std::vector< std::vector< std::shared_ptr< psi::Matrix >>> &susc)
  Set the Density Matrix Susceptibility.
- void [set_dipole_polarizability](#) (const std::vector< std::vector< std::shared_ptr< psi::Matrix >>> &susc)
  Set The Density Matrix Dipole Polarizability.
- void [set_dipole_dipole_hyperpolarizability](#) (const std::vector< std::vector< std::shared_ptr< psi::Matrix >>> &susc)
  Set The Density Matrix Dipole-Dipole Hyperpolarizability.
- void [set_quadrupole_polarizability](#) (const std::vector< std::vector< std::shared_ptr< psi::Matrix >>> &susc)
  Set The Density Matrix Quadrupole Polarizability.
- void [set_centres](#) (const std::vector< std::shared_ptr< psi::Vector >> &[centres](#))
  Set the distributed centres' positions.

Allocators

- void [allocate](#) (int fieldRank, int fieldGradientRank, int nsites, int nbf)
  Allocate the Density Matrix Susceptibility.
- void [allocate_dipole_polarizability](#) (int nsites, int nbf)
  Allocate The Density Matrix Dipole Polarizability.
- void [allocate_dipole_dipole_hyperpolarizability](#) (int nsites, int nbf)
  Allocate The Density Matrix Dipole-Dipole Hyperpolarizability.
- void [allocate_quadrupole_polarizability](#) (int nsites, int nbf)
  Allocate The Density Matrix Quadrupole Polarizability.

Descriptors

- std::string type () const

  Type of Parameters.
- std::string name () const

  Name of Parameters.
- bool hasDensityMatrixDipolePolarizability () const

  Does it has dipole polarizability DMS?
- bool hasDensityMatrixDipoleDipoleHyperpolarizability () const

  Does it has dipole-dipole hyperpolarizability DMS?
- bool hasDensityMatrixQuadrupolePolarizability () const

  Does it has quadrupole polarizability DMS?

Accessors

- psi::SharedVector vector (std::string key) const

  Get the vector data.
- psi::SharedMatrix matrix (std::string key) const

  Get the matrix data.
- std::shared_ptr< oepdev::DMTPole > dmtp (std::string key) const

  Get the DMTP data.
- oepdev::SharedOEPotential oep (std::string key) const

  Get the OEP data.
- std::vector< psi::SharedMatrix > dpol (std::string key) const

  Get the DPOL data.
- psi::SharedBasisSet basisset (std::string key) const

  Get the basis set data.
- std::shared_ptr< psi::Matrix > susceptibility (int fieldRank, int fieldGradientRank, int i, int x) const

  Grab the Density Matrix Susceptibility.
- std::vector< std::shared_ptr< psi::Matrix > > susceptibility (int fieldRank, int fieldGradientRank, int i) const

  Grab the Density Matrix Susceptibility.
- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > susceptibility (int fieldRank, int fieldGradientRank) const

  Grab the Density Matrix Susceptibility.
- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > dipole_polarizability () const

  Grab the density matrix dipole polarizability tensor.
- std::vector< std::shared_ptr< psi::Matrix > > dipole_polarizability (int i) const

  Grab the density matrix dipole polarizability tensor's x-th component.
- std::shared_ptr< psi::Matrix > dipole_polarizability (int i, int x) const

  Grab the density matrix dipole polarizability tensor's x-th component of the i-th distributed site.
- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > dipole_dipole_hyperpolarizability () const

  Grab the density matrix dipole-dipole hyperpolarizability tensor.
- std::vector< std::shared_ptr< psi::Matrix > > dipole_dipole_hyperpolarizability (int i) const

Grab the density matrix dipole-dipole hyperpolarizability tensor's x-th component.

- std::shared_ptr< psi::Matrix > dipole_dipole_hyperpolarizability (int i, int x) const

  Grab the density matrix dipole-dipole hyperpolarizability tensor's x-th component of the i-th distributed site.

- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > quadrupole_polarizability () const

  Grab the density matrix quadrupole polarizability tensor.

- std::vector< std::shared_ptr< psi::Matrix > > quadrupole_polarizability (int i) const

  Grab the density matrix quadrupole polarizability tensor's x-th component.

- std::shared_ptr< psi::Matrix > quadrupole_polarizability (int i, int x) const

  Grab the density matrix quadrupole polarizability tensor's x-th component of the i-th distributed site.

- std::vector< std::shared_ptr< psi::Vector > > centres () const

  Grab the centres' positions.

- std::shared_ptr< psi::Vector > centre (int i) const

  Grab the position of the i-th distributed site.

DMS Computers

- std::shared_ptr< psi::Matrix > compute_density_matrix (std::shared_ptr< psi::Vector > field)

  Compute the density matrix due to the uniform electric field perturbation.

- std::shared_ptr< psi::Matrix > compute_density_matrix (double fx, double fy, double fz)

  Compute the density matrix due to the uniform electric field perturbation.

- std::shared_ptr< psi::Matrix > compute_density_matrix (std::vector< std::shared_ptr< psi::Vector >> fields)

  Compute the density matrix due to the non-uniform electric field perturbation.

- std::shared_ptr< psi::Matrix > compute_density_matrix (std::vector< std::shared_ptr< psi::Vector >> fields, std::vector< std::shared_ptr< psi::Matrix >> grads)

  Compute the density matrix due to the non-uniform electric field perturbation.

Protected Attributes

Qualifiers

Compute the interaction energy between this and other EFP2 fragment.

Parameters

par	- other parameters object

- std::string name_

  The Name of Parameter.

- std::string type_

  The Type of Parameter.

- bool hasDensityMatrixDipolePolarizability_

  The Name of Parameter.

- bool hasDensityMatrixDipoleDipoleHyperpolarizability_

    The Name of Parameter.
- bool hasDensityMatrixQuadrupolePolarizability_

    The Name of Parameter.

Matrices and Multipoles

- std::vector< std::shared_ptr< psi::Vector > > distributedCentres_

    The Positions of the Distributed Centres.
- std::map< std::string, psi::SharedVector > data_vector_

    Data for Vector Types by Keyword.
- std::map< std::string, psi::SharedMatrix > data_matrix_

    Data for Matrix Types by Keyword.
- std::map< std::string, std::shared_ptr< oepdev::DMTPole > > data_dmtp_

    Data for DMTP Types by Keyword.
- std::map< std::string, oepdev::SharedOEPotential > data_oep_

    Data for OEP Types by Keyword.
- std::map< std::string, std::vector< psi::SharedMatrix > > data_dpol_

    Data for DMTP Types by Keyword.
- std::map< std::string, psi::SharedBasisSet > data_basisset_

    Data for AO Basis Set by Keyword.

Density Matrix Susceptibility

- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > densityMatrixDipolePolarizability_

    The Density Matrix Dipole Polarizability.
- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > densityMatrixDipoleDipoleHyperpolarizability_

    The Density Matrix Dipole-Dipole Hyperpolarizability.
- std::vector< std::vector< std::shared_ptr< psi::Matrix > > > densityMatrixQuadrupolePolarizability_

    The Density Matrix Quadrupole Polarizability.

Constructor and Destructor

- GenEffPar (std::string name)

    Create with name of this parameter.
- GenEffPar (const GenEffPar ∗)

    Copy Constructor.
- std::shared_ptr< GenEffPar > clone (void) const

    Make a deep copy.
- ∼GenEffPar ()

    Destruct.
- virtual void copy_from (const GenEffPar ∗)

    Deep-copy the matrix and DMTP data.

18.50.1 Detailed Description

See also

  GenEffFrag, GenEffParFactory

18.50.2 Member Function Documentation

18.50.2.1 allocate()

```
void oepdev::GenEffPar::allocate (
        int fieldRank,
        int fieldGradientRank,
        int nsites,
        int nbf ) [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field $\mathbf{F}$
fieldGradientRank	- power dependency with respect to the electric field gradient $\nabla \otimes \mathbf{F}$
nsites	- number of distributed sites
nbf	- number of basis functions in the basis set

The following susceptibilities are supported (fieldRank, fieldGradientRank):

  - (1, 0) - dipole polarizability, interacts with $\mathbf{F}$

  - (2, 0) - dipole-dipole hyperpolarizability, interacts with $\mathbf{F} \otimes \mathbf{F}$

  - (0, 1) - quadrupole polarizability, interacts with $\nabla \otimes \mathbf{F}$

18.50.2.2 basisset()

```
psi::SharedBasisSet oepdev::GenEffPar::basisset (
        std::string key ) const [inline]
```

Parameters

key	- keyword for a basis set

Returns

    basis set data type

18.50.2.3 compute_density_matrix() [1/4]

```
std::shared_ptr<psi::Matrix> oepdev::GenEffPar::compute_density_matrix (
        std::shared_ptr< psi::Vector > field )
```

Parameters

field	- the uniform electric field vector (A.U.)

18.50.2.4 compute_density_matrix() [2/4]

```
psi::SharedMatrix oepdev::GenEffPar::compute_density_matrix (
        double fx,
        double fy,
        double fz )
```

Parameters

fx	- *x*-th Cartesian component of the uniform electric field vector (A.U.)
fy	- *y*-th Cartesian component of the uniform electric field vector (A.U.)
fz	- *z*-th Cartesian component of the uniform electric field vector (A.U.)

18.50.2.5 compute_density_matrix() [3/4]

```
std::shared_ptr<psi::Matrix> oepdev::GenEffPar::compute_density_matrix (
        std::vector< std::shared_ptr< psi::Vector >> fields )
```

Parameters

fields	- the list of non-uniform electric field vector (A.U.) evaluated at the distributed DMatPol sites

18.50.2.6 compute_density_matrix() `[4/4]`

```
std::shared_ptr<psi::Matrix> oepdev::GenEffPar::compute_density_matrix (
          std::vector< std::shared_ptr< psi::Vector >> fields,
          std::vector< std::shared_ptr< psi::Matrix >> grads )
```

Parameters

fields	- the list of electric field vectors (A.U.) evaluated at the distributed DMatPol sites
grads	- the list of electric field gradient matrices (A.U.) evaluated at the distributed DMatPol sites

18.50.2.7 dmtp()

```
std::shared_ptr<oepdev::DMTPole> oepdev::GenEffPar::dmtp (
          std::string key ) const [inline]
```

Parameters

key	- keyword for a DMTP

Returns

DMTP data type

18.50.2.8 dpol()

```
std::vector<psi::SharedMatrix> oepdev::GenEffPar::dpol (
          std::string key ) const [inline]
```

Parameters

key	- keyword for a DPOL

Returns

DPOL data type

18.50.2.9   matrix()

```
psi::SharedMatrix oepdev::GenEffPar::matrix (
          std::string key ) const [inline]
```

Parameters

key	- keyword for a matrix

Returns

matrix data type

18.50.2.10   oep()

```
oepdev::SharedOEPotential oepdev::GenEffPar::oep (
          std::string key ) const [inline]
```

Parameters

key	- keyword for a OEP

Returns

OEP data type

18.50.2.11   rotate()

```
void oepdev::GenEffPar::rotate (
          psi::SharedMatrix R )
```

Parameters

R	- the rotation matrix

18.50.2.12   set_basisset()

```
void oepdev::GenEffPar::set_basisset (
          std::string key,
          psi::SharedBasisSet basis ) [inline]
```

Parameters

key	- keyword for a matrix
mat	- matrix

This sets the item in the map `data_basisset_`.

18.50.2.13 set_dmtp()

```
void oepdev::GenEffPar::set_dmtp (
        std::string key,
        std::shared_ptr< oepdev::DMTPole > mat ) [inline]
```

Parameters

key	- keyword for a DMTP
dmtp	- DMTP object

This sets the item in the map `data_dmtp_`.

18.50.2.14 set_dpol()

```
void oepdev::GenEffPar::set_dpol (
        std::string key,
        std::vector< psi::SharedMatrix > mats ) [inline]
```

Parameters

key	- keyword for a DPOL
dmtp	- DPOL object

This sets the item in the map `data_dpol_`.

18.50.2.15 set_matrix()

```
void oepdev::GenEffPar::set_matrix (
        std::string key,
        psi::SharedMatrix mat ) [inline]
```

Parameters

key	- keyword for a matrix
mat	- matrix

This sets the item in the map `data_matrix_`.

18.50.2.16 set_oep()

```
void oepdev::GenEffPar::set_oep (
        std::string key,
        oepdev::SharedOEPotential oep ) [inline]
```

Parameters

key	- keyword for a OEP
oep	- OEP object

This sets the item in the map `data_oep_`.

18.50.2.17 set_susceptibility()

```
void oepdev::GenEffPar::set_susceptibility (
        int fieldRank,
        int fieldGradientRank,
        const std::vector< std::vector< std::shared_ptr< psi::Matrix >>>
& susc ) [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field $\mathbf{F}$
fieldGradientRank	- power dependency with respect to the electric field gradient $\nabla \otimes \mathbf{F}$
susc	- the susceptibility tensor

The following susceptibilities are supported (fieldRank, fieldGradientRank):

- (1, 0) - dipole polarizability, interacts with $\mathbf{F}$

- (2, 0) - dipole-dipole hyperpolarizability, interacts with $\mathbf{F} \otimes \mathbf{F}$

- (0, 1) - quadrupole polarizability, interacts with $\nabla \otimes \mathbf{F}$

18.50.2.18 set_vector()

```
void oepdev::GenEffPar::set_vector (
        std::string key,
        psi::SharedVector mat ) [inline]
```

Parameters

key	- keyword for a vector
mat	- vector

This sets the item in the map `data_vector_`.

18.50.2.19 superimpose()

```
void oepdev::GenEffPar::superimpose (
          psi::SharedMatrix targetXYZ,
          std::vector< int > supList )
```

Parameters

targetXYZ	- the target geometry
suplist	- the superimposition list

18.50.2.20 susceptibility() [1/3]

```
std::shared_ptr<psi::Matrix> oepdev::GenEffPar::susceptibility (
          int fieldRank,
          int fieldGradientRank,
          int i,
          int x ) const [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field
fieldGradientRank	- power dependency with respect to the electric field gradient
i	- id of the distributed site
x	- id of the composite Cartesian component

The following susceptibilities are supported (fieldRank, fieldGradientRank):

- (1, 0) - dipole polarizability, interacts with $\mathbf{F}$

- (2, 0) - dipole-dipole hyperpolarizability, interacts with $\mathbf{F} \otimes \mathbf{F}$

- (0, 1) - quadrupole polarizability, interacts with $\nabla \otimes \mathbf{F}$

The distributed sites are assumed to be atomic sites or molecular orbital centroids (depending on the polarization factory used). For the electric field, the composite Cartesian index is just an ordinary Cartesian index. For the electric field gradient and electric field squared, the composite Cartesian index is given as

$$I(x,y) = 3x + y$$

where the values of 0, 1 and 2 correspond to x, y and z Cartesian components, respectively. Therefore, in the latter case, there is 9 distinct composite Cartesian components.

18.50.2.21 susceptibility() [2/3]

```
std::vector<std::shared_ptr<psi::Matrix> > oepdev::GenEffPar::susceptibility
(
            int fieldRank,
            int fieldGradientRank,
            int i ) const [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field
fieldGradientRank	- power dependency with respect to the electric field gradient
i	- id of the distributed site

The following susceptibilities are supported (fieldRank, fieldGradientRank):

- (1, 0) - dipole polarizability, interacts with $\mathbf{F}$

- (2, 0) - dipole-dipole hyperpolarizability, interacts with $\mathbf{F} \otimes \mathbf{F}$

- (0, 1) - quadrupole polarizability, interacts with $\nabla \otimes \mathbf{F}$

The distributed sites are assumed to be atomic sites or molecular orbital centroids (depending on the polarization factory used).

18.50.2.22 susceptibility() [3/3]

```
std::vector<std::vector<std::shared_ptr<psi::Matrix> > > oepdev::GenEffPar::susceptibi
(
            int fieldRank,
            int fieldGradientRank ) const [inline]
```

Parameters

fieldRank	- power dependency with respect to the electric field
fieldGradientRank	- power dependency with respect to the electric field gradient

The following susceptibilities are supported (fieldRank, fieldGradientRank):

- (1, 0) - dipole polarizability, interacts with $\mathbf{F}$

- (2, 0) - dipole-dipole hyperpolarizability, interacts with $\mathbf{F} \otimes \mathbf{F}$

- (0, 1) - quadrupole polarizability, interacts with $\nabla \otimes \mathbf{F}$

18.50.2.23 translate()

```
void oepdev::GenEffPar::translate (
          psi::SharedVector t )
```

Parameters

t	- the translation vector

18.50.2.24 vector()

```
psi::SharedVector oepdev::GenEffPar::vector (
          std::string key ) const [inline]
```

Parameters

key	- keyword for a vector

Returns

vector data type

The documentation for this class was generated from the following files:

- oepdev/libgefp/gefp.h
- oepdev/libgefp/gefp.cc

18.51 oepdev::GenEffParFactory Class Reference

Generalized Effective Fragment Factory. Abstract Base.

```
#include <gefp.h>
```

Inheritance diagram for oepdev::GenEffParFactory:

Public Member Functions

Executor of the Factory

- virtual std::shared_ptr< GenEffPar > compute (void)=0

Compute the fragment parameters.

Accessors

- virtual std::shared_ptr< psi::Wavefunction > wfn (void) const

  Grab wavefunction.
- virtual psi::Options & options (void) const

  Grab options.
- std::shared_ptr< oepdev::CPHF > cphf_solver () const

  Grab the CPHF object.
- std::shared_ptr< oepdev::DMTPole > dmtp () const

  Grab the DMTP object.

Protected Attributes

Basic data

- std::shared_ptr< psi::Wavefunction > wfn_

  Wavefunction.
- psi::Options & options_

  Psi4 Options.
- const int nbf_

  Number of basis functions.

Padding of box

- double cx_

  Centre-of-mass coordinates.
- double cy_

  Centre-of-mass coordinates.
- double cz_

  Centre-of-mass coordinates.
- double radius_

  Radius of padding sphere around the molecule.

Container objects

- std::shared_ptr< oepdev::CPHF > cphfSolver_

  The CPHF object.
- std::shared_ptr< oepdev::DMTPole > dmtpSolver_

  The DMTP object.
- std::shared_ptr< oepdev::QUAMBO > quamboSolver_

  The QUAMBO object.

Other Factories

- std::shared_ptr< oepdev::GenEffParFactory > abInitioPolarizationSusceptibilitiesFactory_

  Ab initio polarization susceptibility factory.

Constructors and Desctructor

- static std::shared_ptr< GenEffParFactory > build (const std::string &type, std::shared_ptr< psi::Wavefunction > wfn, psi::Options &opt)

  Build Density Matrix Susceptibility Generalized Factory.

- static std::shared_ptr< GenEffParFactory > build (const std::string &type, std::shared_ptr< psi::Wavefunction > wfn, psi::Options &opt, psi::SharedBasisSet aux, psi::SharedBasisSet intermed)

  Build Density Matrix Susceptibility Generalized Factory.

- GenEffParFactory (std::shared_ptr< psi::Wavefunction > wfn, psi::Options &opt)

  Construct from wavefunction and Psi4 options.

- virtual ∼GenEffParFactory ()

  Destruct.

Random number generation

- std::default_random_engine randomNumberGenerator_

  Draw random number.

- std::uniform_real_distribution< double > randomDistribution_

  Draw random number.

- virtual double random_double ()

  Draw random number.

- virtual std::shared_ptr< psi::Vector > draw_random_point ()

  Draw random point in 3D space, excluding the vdW region.

Van der Waals region

- std::shared_ptr< psi::Matrix > excludeSpheres_

  Matrix with vdW sphere information.

- std::map< std::string, double > vdwRadius_

  Map with vdW radii.

- virtual bool is_in_vdWsphere (double x, double y, double z) const

  Is the point inside a vdW region?

18.51.1 Detailed Description

Describes the GEFP fragment that is in principle designed to work at correlated levels of theory.

GenEffPar, GenEffFrag

18.51.2 Member Function Documentation

18.51.2.1 build() [1/2]

```
static std::shared_ptr<GenEffParFactory> oepdev::GenEffParFactory::build (
        const std::string & type,
        std::shared_ptr< psi::Wavefunction > wfn,
        psi::Options & opt ) [static]
```

Parameters

type	- Type of factory
wfn	- Psi4 wavefunction
opt	- Psi4 options

Available factory types:

- `POLARIZATION` - creates the polarization generalized effective fragment parameters' factory Factory subtype is specified in Psi4 options (input file).

Note

Useful options:

- `POLARIZATION` factory type:
  - `DMATPOL_TRAINING_MODE` - training mode. Default: `EFIELD`
  - `DMATPOL_NSAMPLES` - number of random samples (field or test charges sets). Default: `30`
  - `DMATPOL_FIELD_SCALE` - electric field scale factor (relevant if training mode is `EFIELD`). Default: `0.01` [au]
  - `DMATPOL_NTEST_CHARGE` - number of test charges per sample (relevant if training mode is `CHARGES`). Default: `1`
  - `DMATPOL_TEST_CHARGE` - test charge value (relevant if training mode is `CHARGES`). Default: `0.001` [au]
  - `DMATPOL_FIELD_RANK` - electric field rank. Default: `1`
  - `DMATPOL_GRADIENT_RANK` - electric field gradient rank. Default: `0`
  - `DMATPOL_TEST_FIELD_X` - test electric field in X direction. Default: `0.000` [au]
  - `DMATPOL_TEST_FIELD_Y` - test electric field in Y direction. Default: `0.000` [au]
  - `DMATPOL_TEST_FIELD_Z` - test electric field in Z direction. Default: `0.008` [au]
  - `DMATPOL_OUT_STATS` - output file name for statistical evaluation results. Default: `dmatpol.stats.dat`

- **–** DMATPOL_DO_AB_INITIO - compute ab initio susceptibilities and evaluate statistics for it. Default: `false`
- **–** DMATPOL_OUT_STATS_AB_INITIO - output file name for statistical evaluation results of ab initio model. Default: `dmatpol.stats.abinitio.dat`

18.51.2.2 build() `[2/2]`

```
static std::shared_ptr<GenEffParFactory> oepdev::GenEffParFactory::build (
        const std::string & type,
        std::shared_ptr< psi::Wavefunction > wfn,
        psi::Options & opt,
        psi::SharedBasisSet aux,
        psi::SharedBasisSet intermed ) [static]
```

Parameters

type	- Type of factory
wfn	- Psi4 wavefunction
opt	- Psi4 options

Available factory types:

- `POLARIZATION` - creates the polarization generalized effective fragment parameters' factory Factory subtype is specified in Psi4 options (input file).

Note

Useful options:

- `POLARIZATION` factory type:
    - **–** DMATPOL_TRAINING_MODE - training mode. Default: `EFIELD`
    - **–** DMATPOL_NSAMPLES - number of random samples (field or test charges sets). Default: `30`
    - **–** DMATPOL_FIELD_SCALE - electric field scale factor (relevant if training mode is `EFIELD`). Default: `0.01` [au]
    - **–** DMATPOL_NTEST_CHARGE - number of test charges per sample (relevant if training mode is `CHARGES`). Default: `1`
    - **–** DMATPOL_TEST_CHARGE - test charge value (relevant if training mode is `CHARGES`). Default: `0.001` [au]
    - **–** DMATPOL_FIELD_RANK - electric field rank. Default: `1`
    - **–** DMATPOL_GRADIENT_RANK - electric field gradient rank. Default: `0`
    - **–** DMATPOL_TEST_FIELD_X - test electric field in X direction. Default: `0.000` [au]
    - **–** DMATPOL_TEST_FIELD_Y - test electric field in Y direction. Default: `0.000` [au]

- DMATPOL_TEST_FIELD_Z - test electric field in Z direction. Default: `0.008` [au]
- DMATPOL_OUT_STATS - output file name for statistical evaluation results. Default: `dmatpol.stats.dat`
- DMATPOL_DO_AB_INITIO - compute ab initio susceptibilities and evaluate statistics for it. Default: `false`
- DMATPOL_OUT_STATS_AB_INITIO - output file name for statistical evaluation results of ab initio model. Default: `dmatpol.stats.abinitio.dat`

18.52   oepdev::GeneralizedDensityFit Class Reference

Generalized Density Fitting Scheme. Abstract Base.

`#include <oep_gdf.h>`

Inheritance diagram for oepdev::GeneralizedDensityFit:
Public Member Functions

- GeneralizedDensityFit ()

    Constructor. Initializes the pointers.

- virtual ∼GeneralizedDensityFit ()

    Destructor.

- virtual std::shared_ptr< psi::Matrix > compute (void)=0

    Perform the generalized density fit.

- std::shared_ptr< psi::Matrix > G (void) const

    Extract the $G_{\xi i}$ coefficients.

Static Public Member Functions

- static std::shared_ptr< GeneralizedDensityFit > build (std::shared_ptr< psi::BasisSet > bs_auxiliary, std::shared_ptr< psi::Matrix > v_vector)

    Factory for Single GDF Computer.

- static std::shared_ptr< [GeneralizedDensityFit](#) > [build](#) (std::shared_ptr< psi::BasisSet > bs_auxiliary, std::shared_ptr< psi::BasisSet > bs_intermediate, std::shared_ptr< psi::Matrix > v_vector)

  Factory for Double GDF Computer.

- static std::shared_ptr< [GeneralizedDensityFit](#) > [build](#) (std::shared_ptr< psi::BasisSet > bs_auxiliary, std::shared_ptr< psi::BasisSet > bs_intermediate, std::shared_ptr< psi::Matrix > v_vector, int dummy)

  Factory for Overlap GDF Computer.

Protected Member Functions

- void [invert_matrix](#) (std::shared_ptr< psi::Matrix > &M)

  Invert a square matrix and check if the inverse is acceptable.

Protected Attributes

- std::shared_ptr< psi::Matrix > [G_](#)

  The OEP coefficients $G_{\xi i}$.

- std::shared_ptr< psi::Matrix > [H_](#)

  The intermediate DF coefficients for $\hat{v}|i)$.

- std::shared_ptr< psi::Matrix > [V_](#)

  The V matrix $(\xi|\hat{v}i)$.

- int [n_a_](#)

  Number of auxiliary basis set functions.

- int [n_i_](#)

  Number of intermediate basis set functions.

- int [n_o_](#)

  Number of OEP's.

- std::shared_ptr< psi::BasisSet > [bs_a_](#)

  Basis set: auxiliary.

- std::shared_ptr< psi::BasisSet > [bs_i_](#)

  Basis set: intermediate.

- std::shared_ptr< [oepdev::IntegralFactory](#) > [ints_aa_](#)

  Integral factory: aux - aux.

- std::shared_ptr< [oepdev::IntegralFactory](#) > [ints_ai_](#)

  Integral factory: aux - int.

- std::shared_ptr< [oepdev::IntegralFactory](#) > [ints_ii_](#)

  Integral factory: int - int.

18.52.1 Detailed Description

Performs the following map:

$$\hat{v}|i\rangle \cong \sum_{\eta} G_{\eta i}|\eta\rangle$$

where $\hat{v}$ is the effective one-electron potential (OEP) operator, $|i\rangle$ is an arbitrary state vector and $|\eta\rangle$ is an auxiliary basis vector. The coefficients $G_{\eta i}$ are stored and define the OEP acting on the state i. The mapping onto the auxiliary space can be done in two ways:

- **Single Density Fit.** This method requires the auxiliary basis set to be nearly complete.

- **Double Density Fit.** This method can be used to arbitrary auxiliary basis sets.

18.52.2 Member Function Documentation

18.52.2.1 build() [1/3]

```
std::shared_ptr< GeneralizedDensityFit > GeneralizedDensityFit::build (
        std::shared_ptr< psi::BasisSet > bs_auxiliary,
        std::shared_ptr< psi::Matrix > v_vector ) [static]
```

Parameters

bs_auxiliary	- auxiliary basis set
v_vector	- the matrix with $V_{\xi i}$ elements

Returns

Generalized Density Fit Computer.

18.52.2.2 build() [2/3]

```
std::shared_ptr< GeneralizedDensityFit > GeneralizedDensityFit::build (
        std::shared_ptr< psi::BasisSet > bs_auxiliary,
        std::shared_ptr< psi::BasisSet > bs_intermediate,
        std::shared_ptr< psi::Matrix > v_vector ) [static]
```

Parameters

bs_auxiliary	- auxiliary basis set
bs_intermediate	- intermediate basis set
v_vector	- the matrix with $V_{\varepsilon i}$ elements

Returns

Generalized Density Fit Computer.

18.52.2.3 build() `[3/3]`

```
std::shared_ptr< GeneralizedDensityFit > GeneralizedDensityFit::build (
          std::shared_ptr< psi::BasisSet > bs_auxiliary,
          std::shared_ptr< psi::BasisSet > bs_intermediate,
          std::shared_ptr< psi::Matrix > v_vector,
          int dummy ) [static]
```

Parameters

bs_auxiliary	- auxiliary basis set
bs_intermediate	- intermediate basis set
v_vector	- the matrix with $V_{\varepsilon i}$ elements
dummy	- a dummy variable (not used)

Returns

Generalized Density Fit Computer.

18.52.2.4 compute()

```
std::shared_ptr< psi::Matrix > GeneralizedDensityFit::compute (
          void ) [pure virtual]
```

Returns

The OEP coefficients $G_{\xi i}$

Implemented in oepdev::OverlapGeneralizedDensityFit, oepdev::DoubleGeneralizedDensityFit, and oepdev::SingleGeneralizedDensityFit.

The documentation for this class was generated from the following files:

18.53 oepdev::GeneralizedPolarGEFactory Class Reference

Polarization GEFP Factory with Least-Squares Parameterization.

```
#include <gefp.h>
```

Inheritance diagram for oepdev::GeneralizedPolarGEFactory:

Classes

- struct StatisticalSet

    A structure to handle statistical data.

Public Member Functions

- GeneralizedPolarGEFactory (std::shared_ptr< psi::Wavefunction > wfn, psi::Options &opt)

    Construct from Psi4 wavefunction and options.

- virtual ∼GeneralizedPolarGEFactory ()

    Destruct.

- virtual std::shared_ptr< GenEffPar > compute (void)

    Peform Least-Squares Fit.

- bool has_dipole_polarizability () const

    Dipole Polarizability (interacting with $\mathbf{F}$)

- bool has_dipole_dipole_hyperpolarizability () const

    Dipole-Dipole Hyperpolarizability (interacting with $\mathbf{F}^2$)

- bool has_quadrupole_polarizability () const

    Quadrupole Polarizability (interacting with $\nabla \otimes \mathbf{F}$)

- bool has_ab_initio_dipole_polarizability () const

    Ab Initio Dipole Polarizability (interacting with $\mathbf{F}$)

- double Zinit () const

    Grab initial summaric Z value.

- double Z () const

    Grab final summaric Z value.

Protected Member Functions

- void allocate (void)

    Allocate memory.

- void invert_hessian (void)

    Invert Hessian (do also the identity test)

- void compute_electric_field_sums (void)

    Compute electric field sum set.

- void compute_electric_field_gradient_sums (void)

    Compute electric field gradient sum set.

- void compute_statistics (void)

    Run the statistical evaluation of results.

- void set_distributed_centres (void)

    Set the distributed centres.

- void compute_parameters (void)

    Compute the parameters.

- void fit (void)

    Perform least-squares fit.

- void compute_ab_initio (void)

    Compute ab initio parameters.

- void save (int i, int j)

    Save susceptibility tensors associated with the i-th and j-th basis set function.

- virtual void compute_samples (void)=0

    Compute samples of density matrices and select electric field distributions.

- virtual void compute_gradient (int i, int j)=0

    Compute Gradient vector associated with the i-th and j-th basis set function.

- virtual void compute_hessian (void)=0

    Compute Hessian matrix (independent on the parameters)

Protected Attributes

- int nBlocks_

    Number of parameter blocks.

- int nSites_

    Number of distributed sites.

- int nSitesAbInitio_

    Number of distributed sites of Ab Initio model (FF - single site (com); distributed: LMO sites)

- int nParameters_

    Dimensionality of entire parameter space.

- std::vector< int > nParametersBlock_

    Dimensionality of parameter space per block.

- const int nSamples_

    Number of statistical samples.

- const double symmetryNumber_ [6]

    Symmetry number for matrix susceptibilities.

- std::shared_ptr< psi::Matrix > Gradient_

Gradient.

- std::shared_ptr< psi::Matrix > Hessian_

  Hessian.

- std::shared_ptr< psi::Matrix > Parameters_

  Parameters.

- std::shared_ptr< oepdev::GenEffPar > PolarizationSusceptibilities_

  Density Matrix Susceptibility Tensors Object.

- std::shared_ptr< oepdev::GenEffPar > abInitioPolarizationSusceptibilities_

  Density Matrix Susceptibility Tensors Object for Ab Initio Model.

- bool hasDipolePolarizability_

  Has Dipole Polarizability?

- bool hasDipoleDipoleHyperpolarizability_

  Has Dipole-Dipole Hyperpolarizability?

- bool hasQuadrupolePolarizability_

  Has Quadrupole Polarizability?

- bool hasAbInitioDipolePolarizability_

  Has Ab Initio Dipole Polarizability?

- StatisticalSet referenceStatisticalSet_

  Reference statistical data.

- StatisticalSet referenceDpolStatisticalSet_

  Multipole reference statistical data.

- StatisticalSet modelStatisticalSet_

  Model statistical data.

- StatisticalSet abInitioModelStatisticalSet_

  Ab Initio Model statistical data.

- std::vector< std::shared_ptr< psi::Matrix > > VMatrixSet_

  Potential matrix set.

- std::vector< std::vector< std::shared_ptr< Vector > > > electricFieldSet_

  Electric field set.

- std::vector< std::vector< std::shared_ptr< Matrix > > > electricFieldGradientSet_

  Electric field gradient set.

- std::vector< std::vector< double > > electricFieldSumSet_

  Electric field sum set.

- std::vector< std::vector< std::shared_ptr< psi::Vector > > > electricFieldGradientSum-Set_

  Electric field gradient sum set.

- std::vector< std::vector< std::shared_ptr< Vector > > > abInitioModelElectricFieldSet_

  Electric field set for Ab Initio Model (LMO-distributed)

- const double mField_

  Level shifters for Hessian blocks.

- double Zinit_

    Initial summaric Z value.
- double Z_

    Final summaric Z value.
- std::shared_ptr< psi::JK > jk_

    Computer of generalized JK objects.

Additional Inherited Members

18.53.1 Detailed Description

Implements a general class of methods for the density matrix susceptibility tensors represented by:

$$\delta D_{\alpha\beta} = \sum_i \left\{ \mathbf{B}_{i;\alpha\beta}^{(10)} \cdot \mathbf{F}(\mathbf{r}_i) + \mathbf{B}_{i;\alpha\beta}^{(20)} : \mathbf{F}(\mathbf{r}_i) \otimes \mathbf{F}(\mathbf{r}_i) + \mathbf{B}_{i;\alpha\beta}^{(01)} : \nabla_i \otimes \mathbf{F}(\mathbf{r}_i) + \dots \right\}$$

where:

- $\mathbf{B}_{i;\alpha\beta}^{(10)}$ is the density matrix dipole polarizability

- $\mathbf{B}_{i;\alpha\beta}^{(20)}$ is the density matrix dipole-dipole hyperpolarizability

- $\mathbf{B}_{i;\alpha\beta}^{(01)}$ is the density matrix quadrupole polarizability

all defined for the generalized distributed site at $\mathbf{r}_i$.

Available models:

1. Training against uniform electric fields

    - oepdev::LinearUniformEFieldPolarGEFactory - linear with respect to electric field
    - oepdev::QuadraticUniformEFieldPolarGEFactory - quadratic with respect to electric field

2. Training against non-uniform electric fields

    - oepdev::LinearNonUniformEFieldPolarGEFactory - linear with respect to electric field, distributed site model
    - oepdev::QuadraticNonUniformEFieldPolarGEFactory - quadratic with respect to electric field, distributed site model
    - oepdev::LinearGradientNonUniformEFieldPolarGEFactory - linear with respect to electric field and linear with respect to electric field gradient, distributed site model. This model does not function now.
    - oepdev::QuadraticGradientNonUniformEFieldPolarGEFactory - linear with respect to electric field and linear with respect to electric field gradient, distributed site model. This model does not function now.

For the non-linear field training, a set of point charges in each training sample is assumed. Distributed models use atomic centers as expansion points.

Determination of the generalized susceptibilities

Let $\left\{ \mathbf{F}^{(1)}(\mathbf{r}), \mathbf{F}^{(2)}(\mathbf{r}), \ldots, \mathbf{F}^{(N)}(\mathbf{r}), \ldots \right\}$ be a set of $N_{\max}$ distinct and randomly sampled spatial distributions of electric field. It is assumed that the exact difference one-particle density matrices (with respect to the unperturbed state) defined as

$$\delta \overline{\mathbf{D}}^{(N)} \equiv \overline{\mathbf{D}}^{(N)} - \overline{\mathbf{D}}^{(0)}$$

are known for each sample (overline symbolizes the exact estimate). Now, for each pair of the AO indices the following parameterization is constructed:

$$\delta D^{(N)} = \sum_i^M \left\{ \sum_u^{x,y,z} s_{iu}^{[1]} F_{iu}^{(N)} + \sum_u^{x,y,z} \sum_{w<u} r_{uw} s_{iuw}^{[2]} F_{iu}^{(N)} F_{iw}^{(N)} + \cdots \right\}$$

(the Greek subscripts were omitted here for notational simplicity). In the above equation, $B_u^{(i;1)} = s_{iu}^{[1]}$ and $B_{uw}^{(i;2)} = r_{uw} s_{iuw}^{[2]}$, where r_{uw} is the symmetry factor equal to 1 for diagonal elements and 2 for off-diagonal elements of $B_{uw}^{(i;2)}$. The multiple parameter blocks ($\mathbf{s}^{[1]}$, $\mathbf{s}^{[2]}$ and so on) appear in the first power, allowing for linear least-squares regression. The square bracket superscripts denote the block of the parameter space.

To determine the optimum set, $\mathbf{s} = \begin{pmatrix} \mathbf{s}^{[1]} & \mathbf{s}^{[2]} & \cdots \end{pmatrix}^{\mathrm{T}}$, a loss function Z that is subject to the least-squares minimization, is defined as

$$Z(\mathbf{s}) = \sum_N^{N_{\max}} \left(\delta D^{(N)} - \delta \overline{D}^{(N)} \right)^2 .$$

The Hessian of Z computed with respect to the parameters is parameter-independent (constant) and generally non-singular as long as the electric fields on all distributed sites are different. Therefore, the exact solution for the optimal parameters is given by the Newton equation

$$\mathbf{s} = -\mathbf{H}^{-1} \cdot \mathbf{g} ,$$

where $\mathbf{g}$ and $\mathbf{H}$ are the gradient vector and the Hessian matrix, respectively. Note that in this case the dimensions of parameter space for the block 1 and 2 are equal to $3M$ and $6M$, respectively. The explicit forms of the gradient and Hessian up to second-order are given in the next section.

Explicit Formulae for Gradient and Hessian Blocks in Linear Regression DMS Model

The gradient vector $\mathbf{g}$ and the Hessian matrix $\mathbf{H}$ are built from blocks associated with a particular type of parameters, i.e.,

$$\mathbf{g} = \begin{pmatrix} \mathbf{g}^{[1]} \\ \mathbf{g}^{[2]} \end{pmatrix}, \quad \mathbf{H} = \begin{pmatrix} \mathbf{H}^{[11]} & \mathbf{H}^{[12]} \\ \mathbf{H}^{[21]} & \mathbf{H}^{[22]} \end{pmatrix} ,$$

where the block indices 1 and 2 correspond to the first- and second-order susceptibilities, respectively. Note that the second derivatives of $\delta D^{(N)}$ with respect to the adjustable parameters vanish due to the linear functional form of the parameterization formula given in the previous section. Thus, the gradient element of the r-th block and Hessian element of the (rs)-th block read

$$g^{[r]} \equiv \frac{\partial Z}{\partial s^{[r]}} = -2 \sum_N \overline{\delta D}^{(N)} \frac{\partial \left[\delta D^{(N)} \right]}{\partial s^{[r]}} ,$$

$$H^{[rs]} \equiv \frac{\partial^2 Z}{\partial s^{[r]} \partial s^{[s]}} = 2 \sum_N \frac{\partial \left[\delta D^{(N)} \right]}{\partial s^{[r]}} \frac{\partial \left[\delta D^{(N)} \right]}{\partial s^{[s]}} .$$

The explicit formulae for the gradient are

$$g_{ku}^{[1]} = -2 \sum_N \overline{\delta D}^{(N)} F_{ku}^{(N)} \; ,$$

$$g_{kuw}^{[2]} = -2 r_{uw} \sum_N \overline{\delta D}^{(N)} F_{ku}^{(N)} F_{kw}^{(N)} \; .$$

The Hessian subsequently follows to be %

$$H_{ku,lw}^{[11]} = 2 \sum_N F_{ku}^{(N)} F_{lw}^{(N)} \; ,$$

$$H_{ku,lu'w'}^{[12]} = 2 r_{u'w'} \sum_N F_{ku}^{(N)} F_{lu'}^{(N)} F_{lw'}^{(N)} \; ,$$

$$H_{kuw,lu'w'}^{[22]} = 2 r_{uw} r_{u'w'} \sum_N F_{ku}^{(N)} F_{kw}^{(N)} F_{lu'}^{(N)} F_{lw'}^{(N)} \; .$$

Note that due to the symmetry of the Hessian matrix, the block 21 is a transpose of the block 12. The composite indices ku and kuw are constructed from the distributed site index k and the appropriate symmetry-adapted ($w < u$) Cartesian component of a particular DMS tensor: u for the first-order, and uw for the second-order susceptibility tensor, respectively. The method described above can be easily extended to third and higher orders.

    Number of vectors.

18.55.1 Detailed Description

Orthonormalize a set of *L* vectors, i.e.,

$$\{\mathbf{v}_k\} \rightarrow \{\mathbf{u}_k\} \text{ for } k = 1, 2, \ldots, L$$

Implementation

The orthogonalized vectors are generated according to

$$\mathbf{u}_k = \left[1 - \sum_{i=1}^{k-1} \hat{P}_{\mathbf{u}_i} \right] \mathbf{v}_k$$

where the projection operator is given by

$$\hat{P}_{\mathbf{u}} = \frac{1}{u^2} \mathbf{u} [\square \cdot \mathbf{u}]$$

18.55.2 Constructor & Destructor Documentation

18.55.2.1 GramSchmidt() [1/2]

```
oepdev::GramSchmidt::GramSchmidt ( )
```

18.55.2.2 GramSchmidt() [2/2]

```
oepdev::GramSchmidt::GramSchmidt (
          std::vector< psi::SharedVector > vectors )
```

Parameters

vectors	- list of vectors to be orthogonalized.

18.55.3 Member Function Documentation

18.55.3.1 projection()

```
psi::SharedVector oepdev::GramSchmidt::projection (
          psi::SharedVector u,
```

```
        psi::SharedVector v ) const
```

Compute the projection vector.

Parameters

u	- projected direction
v	- projected vector

Returns

a new vector $\mathbf{v}'$ such that

$$\mathbf{v}' = \hat{P}_{\mathbf{u}}\mathbf{v}$$

```

Inheritance diagram for oepdev::IntegralFactory:
Public Member Functions

- IntegralFactory (std::shared_ptr< psi::BasisSet > bs1, std::shared_ptr< psi::BasisSet > bs2, std::shared_ptr< psi::BasisSet > bs3, std::shared_ptr< psi::BasisSet > bs4)

    Initialize integral factory given a BasisSet for each center. Becomes (bs1 bs2 | bs3 bs4).

- IntegralFactory (std::shared_ptr< psi::BasisSet > bs1, std::shared_ptr< psi::BasisSet > bs2)

    Initialize integral factory given a BasisSet for two centres. Becomes (bs1 bs2 | bs1 bs2).

- IntegralFactory (std::shared_ptr< psi::BasisSet > bs1)

    Initialize integral factory given a BasisSet for two centres. Becomes (bs1 bs1 | bs1 bs1).

- virtual ~IntegralFactory ()

    Destructor.

- virtual psi::OneBodyAOInt ∗ ao_efp_multipole_potential_new (int max_k=3, int deriv=0)

    Returns an improved EFPMultipolePotentialInt.

- virtual oepdev::TwoBodyAOInt ∗ eri_1_1 (int deriv=0, bool use_shell_pairs=false)

    Returns an ERI_1_1 integral object.

- virtual oepdev::TwoBodyAOInt ∗ eri_2_1 (int deriv=0, bool use_shell_pairs=false)

    Returns an ERI_2_1 integral object.

- virtual oepdev::TwoBodyAOInt ∗ eri_2_2 (int deriv=0, bool use_shell_pairs=false)

    Returns an ERI_2_2 integral object.

- virtual oepdev::TwoBodyAOInt ∗ eri_3_1 (int deriv=0, bool use_shell_pairs=false)

    Returns an ERI_3_1 integral object.

18.58.1 Detailed Description

In addition to integrals available in Psi4, oepdev::IntegralFactory enables to compute also:

- OEI's:

    - none at that moment

- ERI's:

    - integrals of type (a|b) - `oepdev::ERI_1_1`

    - integrals of type (ab|c) - `oepdev::ERI_2_1`

    - integrals of type (abc|d) - `oepdev::ERI_3_1`

    - integrals of type (ab|cd) - `oepdev::ERI_2_2` (also in Psi4 as `psi::ERI`)

The documentation for this class was generated from the following files:

- oepdev/libpsi/integral.h
- oepdev/libpsi/integral.cc

18.59 oepdev::KabschSuperimposer Class Reference

Compute the Cartesian rotation matrix between two structures.

```
#include <kabsch_superimposer.h>
```

Public Member Functions

- KabschSuperimposer ()

  Constructor.
- ∼KabschSuperimposer ()

  Destructor.
- void compute (psi::SharedMatrix initial_xyz, psi::SharedMatrix final_xyz)

  Run the Kabsch algorithm.
- void compute (psi::SharedMolecule initial_mol, psi::SharedMolecule final_mol)

  Run the Kabsch algorithm.
- psi::SharedMatrix get_transformed (void)

  Return transformed coordinates $\mathbf{X}'$.
- double rms (void)

  Compute RMS or superimposition.
- void clear (void)

  Clear all previous calculations.

Public Attributes

- psi::SharedMatrix rotation

  Rotation matrix $\mathbf{r}$.
- psi::SharedVector translation

  Translation vector $\mathbf{t}$.
- psi::SharedMatrix initial_xyz

  Initial xyz $\mathbf{X}$.
- psi::SharedMatrix final_xyz

  Final xyz $\mathbf{X}_0$.

18.59.1 Detailed Description

The superimposition is defined as:

$$\mathbf{X}' = \mathbf{t} + \mathbf{X} \cdot \mathbf{r} \approx \mathbf{X}_0$$

where X_{iu} is the *u*-th Cartesian component of the *i*-th atom's position, $\mathbf{t}$ is the superimposition translation vector, $\mathbf{r}$ is the superimposition rotation matrix, and prime denotes transformed coordinates.

The superimposition uses the Kabsch algorithm.

The Kabsch Algorithm.

Rotation matrix is calculated from

$$\mathbf{r} = \mathbf{U} \cdot \mathbf{V}^{\mathrm{T}}$$

where

$$\mathbf{A} = \mathbf{U} \cdot \mathbf{S} \cdot \mathbf{V}^{\mathrm{T}}$$

is the singular value decomposition of the covariance matrix

$$\mathbf{A} = [\mathbf{X} - \langle \mathbf{X} \rangle]^{\mathrm{T}} \cdot [\mathbf{X}_0 - \langle \mathbf{X}_0 \rangle]$$

The average of position is given by

$$\langle \mathbf{X} \rangle_u = \frac{1}{N} \sum_i X_{iu}$$

where *N* is the number of atoms. If determinant of rotation matrix is negative (indicating inversion), rotation matrix is recomputed by inverting the sign of the third column of $\mathbf{V}$.

The translation vector is then calculated by

$$\mathbf{t} = \langle \mathbf{X}_0 \rangle - \langle \mathbf{X} \rangle \cdot \mathbf{r}$$

18.59.2   Member Function Documentation

18.59.2.1   compute() [1/2]

```
void oepdev::KabschSuperimposer::compute (
        psi::SharedMatrix initial_xyz,
        psi::SharedMatrix final_xyz )
```

Parameters

initial_xyz	- position vectors $\mathbf{X}$
final_xyz	- position vectors $\mathbf{X}_0$

18.59.2.2   compute() [2/2]

```
void oepdev::KabschSuperimposer::compute (
        psi::SharedMolecule initial_mol,
        psi::SharedMolecule final_mol ) [inline]
```

Parameters

initial_mol	- molecule with atomic positions at $\mathbf{X}$
final_mol	- molecule with atomic positions at $\mathbf{X}_0$

18.60 oepdev::LinearGradientNonUniformEFieldPolarGEFactory Class Reference

Polarization GEFP Factory with Least-Squares Parameterization.

```
#include <gefp.h>
```

Inheritance diagram for oepdev::LinearGradientNonUniformEFieldPolarGEFactory:
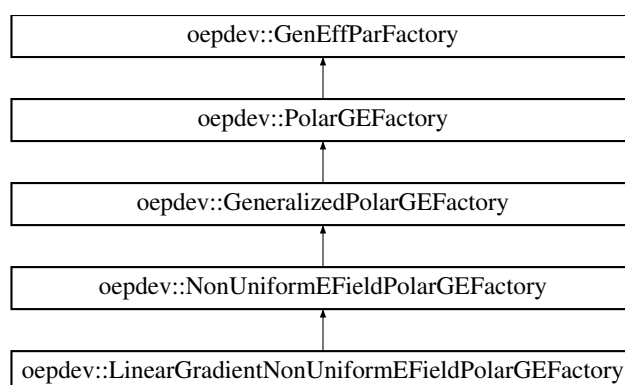

Public Member Functions

- **LinearGradientNonUniformEFieldPolarGEFactory** (std::shared_ptr< psi::Wavefunction > wfn, psi::Options &opt)
- void compute_gradient (int i, int j)

    Compute Gradient vector associated with the i-th and j-th basis set function.
- void compute_hessian (void)

    Compute Hessian matrix (independent on the parameters)

Additional Inherited Members

18.60.1 Detailed Description

Implements the generalized density matrix susceptibility model of the form

$$\delta D_{\alpha\beta} \approx \sum_i \left\{ \mathbf{B}_{i;\alpha\beta}^{(10)} \cdot \mathbf{F}(\mathbf{r}_i) + \mathbf{B}_{i;\alpha\beta}^{(01)} : \nabla_i \otimes \mathbf{F}(\mathbf{r}_i) \right\}$$

where:

- $\mathbf{B}_{i;\alpha\beta}^{(10)}$ is the density matrix dipole polarizability

- $\mathbf{B}_{i;\alpha\beta}^{(01)}$ is the density matrix quadrupole polarizability all defined for the distributed site at $\mathbf{r}_i$.

Note

This model is not available now and probably will be deprecated in the future.

The documentation for this class was generated from the following files:

- oepdev/libgefp/gefp.h

18.65 oepdev::MultipoleConvergence Class Reference

Multipole Convergence.

```
#include <dmtp.h>
```

Public Types

- enum ConvergenceLevel {
  R1, **R2**, **R3**, **R4**,
  R5 }
- enum Property { **Energy**, **Potential**, **Field** }

Public Member Functions

- MultipoleConvergence (std::shared_ptr< DMTPole > dmtp1, std::shared_ptr< DMTPole > dmtp2, ConvergenceLevel max_clevel=R5)

  Construct from two shared DMTPole objects.
- virtual ∼MultipoleConvergence ()

  Destructor.
- void compute (Property property=Energy)
- void compute (const double &x, const double &y, const double &z, Property property=Potential)
- std::shared_ptr< psi::Matrix > level (ConvergenceLevel clevel=R5)

Protected Member Functions

- void compute_energy ()

  Compute the generalized energy.
- void compute_potential (const double &x, const double &y, const double &z)

  Compute the generalized potential.
- void compute_field (const double &x, const double &y, const double &z)

  Compute the generalized field potential.

Protected Attributes

- ConvergenceLevel max_clevel_

  Maximum allowed convergence level.
- std::shared_ptr< DMTPole > dmtp_1_

  First DMTP set.
- std::shared_ptr< DMTPole > dmtp_2_

  Second DMTP set.
- std::map< std::string, std::shared_ptr< psi::Matrix > > convergenceList_

  Dictionary of available convergence level results.
- std::map< std::string, std::shared_ptr< psi::Matrix > > energyConvergencePairs_

  Dictionary of available energy convergence pairs.

18.65.1   Detailed Description

Handles the convergence of the distributed multipole expansions up to hexadecapole. Takes shared pointers to existing DMTPole objects and computes the generalized property:

- energy

- potential from the DMTP sets. The results are stored in matrix of size (N1, N2) where N1 and N2 are equal to the number of DMTP's in a set decribed by according DMTPole object given.

Note

Useful options:

- `DMTP_CONVER` - level of multipole series convergence (available: `R1`, `R2`, `R3`, `R4` and `R5`). Default: `R5`.

See also

DMTPole

18.65.2 Member Enumeration Documentation

18.65.2.1 ConvergenceLevel

enum oepdev::MultipoleConvergence::ConvergenceLevel

Convergence level of the multipole expansion:

Parameters

R1	- qq term
R2	- qd and sum of the above
R3	- qQ, dd and sum of the above
R4	- qO, dQ and sum of the above
R5	- qH, dO, QQ and sum of the above

18.65.2.2 Property

enum oepdev::MultipoleConvergence::Property

Property to be evaluated from DMTP's:

Parameters

Energy	- generalized energy
Field	- generalized field
Potential	- generalized potential

18.65.3 Constructor & Destructor Documentation

18.65.3.1 MultipoleConvergence()

oepdev::MultipoleConvergence::MultipoleConvergence (
        std::shared_ptr< DMTPole > *dmtp1,*
        std::shared_ptr< DMTPole > *dmtp2,*
        MultipoleConvergence::ConvergenceLevel *max_clevel = R5*)

Parameters

dmtp1	- first DMTPole object

Parameters

dmtp2	- second DMTPole object
max_clevel	- maximul allowed convergence level

18.65.4 Member Function Documentation

18.65.4.1 compute() [1/2]

```
void oepdev::MultipoleConvergence::compute (
            MultipoleConvergence::Property property = Energy )
```

Compute the generalized interaction property

Parameters

property	- generalized Property

18.65.4.2 compute() [2/2]

```
void oepdev::MultipoleConvergence::compute (
            const double & x,
            const double & y,
            const double & z,
            MultipoleConvergence::Property property = Potential )
```

Compute the generalized generator property

Parameters

x	- location *x*-th Cartesian component
y	- location *y*-th Cartesian component
z	- location *z*-th Cartesian component
property	- generalized Property

18.65.4.3 level()

```
std::shared_ptr< psi::Matrix > oepdev::MultipoleConvergence::level (
            MultipoleConvergence::ConvergenceLevel clevel = R5 )
```

Grab the generalized property at specified level of convergence

Parameters

clevel	- ConvergenceLevel

Returns

> vector of results (each element corresponds to each DMTP pair in a set)

18.78 oepdev::OEPDevSolver Class Reference

Solver of properties of molecular aggregates. Abstract base.

```
#include <solver.h>
```

Inheritance diagram for oepdev::OEPDevSolver:
Public Member Functions

- OEPDevSolver (SharedWavefunctionUnion wfn_union)

  Take wavefunction union and initialize the Solver.

- virtual ∼OEPDevSolver ()

  Destroctor.

- virtual double compute_oep_based (const std::string &method="DEFAULT")=0

  Compute property by using OEP's.

- virtual double compute_benchmark (const std::string &method="DEFAULT")=0

  Compute property by using benchmark method.

Static Public Member Functions

- static std::shared_ptr< OEPDevSolver > build (const std::string &target, SharedWavefunctionUnion wfn_union)

  Build a solver of a particular property for given molecular cluster.

Protected Attributes

- SharedWavefunctionUnion wfn_union_

  Wavefunction union.

- psi::Options & options_

  Options.

- std::vector< std::string > methods_oepBased_

  Names of all OEP-based methods implemented for a solver.

- std::vector< std::string > methods_benchmark_

  Names of all benchmark methods implemented for a solver.

18.78.1 Detailed Description

Uses only a wavefunction union object to initialize.

Available solvers

- ELECTROSTATIC ENERGY

- REPULSION ENERGY

- CHARGE TRANSFER ENERGY

- EET COUPLING CONSTANT

Options

Interaction Property Method

- OEPDEV_SOLVER_EINT_COUL_AO - Coulombic energy: AO expanded

- OEPDEV_SOLVER_EINT_COUL_MO - Coulombic energy: MO expanded

- OEPDEV_SOLVER_EINT_COUL_ESP - Coulombic energy: ESP

- OEPDEV_SOLVER_EINT_COUL_CAMM - Coulombic energy: CAMM

- OEPDEV_SOLVER_EINT_REP_HS - Exchange-repulsion energy: Hayes-Stone

- OEPDEV_SOLVER_EINT_REP_DDS - Exchange-repulsion energy: DDS

- OEPDEV_SOLVER_EINT_REP_MRW - Exchange-repulsion energy: Murrell et al.

- OEPDEV_SOLVER_EINT_REP_OL - Exchange-repulsion energy: Otto-Ladik

- OEPDEV_SOLVER_EINT_REP_OEP1 - Exchange-repulsion energy: OEP (S1: GDF, S2: ESP)

- OEPDEV_SOLVER_EINT_REP_OEP2 - Exchange-repulsion energy: OEP (S1: GDF, S2: CAMM)

- OEPDEV_SOLVER_EINT_REP_EFP2 - Exchange-repulsion energy: EFP2

- OEPDEV_SOLVER_EINT_CT_OL - Charge-transfer energy: Otto-Ladik

- OEPDEV_SOLVER_EINT_CT_OEP - Charge-transfer energy: OEP

- OEPDEV_SOLVER_EINT_CT_EFP2 - Charge-transfer energy: EFP2

Generalized density fitting (GDF) options:

- OEPDEV_DF_TYPE - type of the GDF. Default: DOUBLE. Other: SINGLE.

- DF_BASIS_OEP - auxiliary basis set. Default: sto-3g.

- DF_BASIS_INT - intermediate basis set. Relevant only if double GDF is used. Default: aug-cc-pVDZ-jkfit. Note that intermediate basis set should be nearly complete.

EFP2 Charge transfer energy options:

- `EFP2_CT_POTENTIAL_INTS` - Type of potential one-electron operator. Default: 'DMTP'. Other: 'ERI'.

- `EFP2_CT_NO_OCTUPOLES` - Ignore octupole moments from potential integrals? Default: `True`.

Excited States

- `EXCITED_STATE` - ID of state for all monomers to consider. If $-n$, then the *n*th bright state is taken. Default: -1.

- `EXCITED_STATE_A` - ID of state for monomer A to consider. If $-n$, then the *n*th bright state is taken. Default: -1.

- `EXCITED_STATE_B` - ID of state for monomer B to consider. If $-n$, then the *n*th bright state is taken. Default: -1.

- `OSCILLATOR_STRENGTH_THRESHOLD` - Threshold for oscillator strength for bright states selection. Default: `0.01`.

- `TrCAMM_SYMMETRIZE` - Whether to use the 'symmetrized transition density' or not. Default: `true`.

- `TI_CIS_SCF_FOCK_MATRIX` - Whether to compute the full SCF Fock matrix for the dimer or approximate it from monomer OPDM's. Default: `false`.

- `TI_CIS_PRINT_FOCK_MATRIX` - Whether to print the Fock matrix (AB block in AO basis) or not. Default: `false`.

Environmental variables

One can easily access those variables from Python level by calling

```
psi4.get_variable("name of variable")
```

in your Python script.

Table 18.95: Environmental variables in the OEPDev solver.

Keyword	Description
Coulombic Interaction Energy	
Distributed Multipole Series	
`EINT COUL CAMM R-1`	CAMM charge-charge terms

Keyword	Description
`EINT COUL CAMM R-2`	CAMM charge-dipole terms + all above
`EINT COUL CAMM R-3`	CAMM charge-quadrupole, dipole-dipole + all above
`EINT COUL CAMM R-4`	CAMM charge-octupole, dipole-quadrupole + all above
`EINT COUL CAMM R-5`	CAMM charge-hexadecapole, dipole-octupole, quadrupole-quadrupole + all above
`EINT COUL ESP`	ESP charge-charge terms
Exact First-Order Perturbation Theory	
`EINT COUL EXACT`	MO or AO expanded Coulombic energy. Both give same results but MO is much faster.
Exchange-Repulsion Interaction Energy	
Density Decomposition Scheme	
`EINT REP DDS KCAL`	Pauli repulsion
`EINT EXC DDS KCAL`	DDS exchange
`EINT EXR DDS KCAL`	Sum of the above
Hayes-Stone model	
`EINT REP HAYES-STONE KCAL`	Pauli repulsion
`EINT EXC HAYES-STONE KCAL`	Pure exchange
`EINT EXR HAYES-STONE KCAL`	Sum of the above
Murrell et al. model	
`EINT REP MURRELL-ETAL KCAL`	Pauli repulsion
`EINT EXC MURRELL-ETAL KCAL`	Pure exchange (same as Hayes-Stone)
`EINT EXR MURRELL-ETAL KCAL`	Sum of the above
`EINT REP MURRELL-ETAL:S1 KCAL`	Pauli repulsion: S^{-1} term
`EINT REP MURRELL-ETAL:S2 KCAL`	Pauli repulsion: S^{-2} term
Otto-Ladik model	
`EINT REP OTTO-LADIK KCAL`	Pauli repulsion
`EINT EXC OTTO-LADIK KCAL`	Pure exchange (same as Hayes-Stone)
`EINT EXR OTTO-LADIK KCAL`	Sum of the above
`EINT REP OTTO-LADIK:S1 KCAL`	Pauli repulsion: S^{-1} term

Keyword	Description
`EINT REP OTTO-LADIK:S2 KCAL`	Pauli repulsion: S^{-2} term

EFP2 model	
`EINT REP EFP2 KCAL`	Pauli repulsion
`EINT EXC EFP2 KCAL`	Exchange: SGO approximation of Jensen
`EINT EXR EFP2 KCAL`	Sum of the above
`EINT REP EFP2:S1 KCAL`	Pauli repulsion: S^{-1} term
`EINT REP EFP2:S2 KCAL`	Pauli repulsion: S^{-2} term

OEP-based models	
`EINT REP OEP-MURRELL-ETAL-1 KCAL`	Pauli repulsion: S1 term using GDF, S2 term using CAMM
`EINT REP OEP-MURRELL-ETAL-1 S1 KCAL`	S^{-1} term of the above total term
`EINT REP OEP-MURRELL-ETAL-1 S2 KCAL`	S^{-2} term of the above total term
`EINT REP OEP-MURRELL-ETAL-2 KCAL`	Pauli repulsion: S1 term using GDF, S2 term using ESP
`EINT REP OEP-MURRELL-ETAL-2 S1 KCAL`	S^{-1} term of the above total term
`EINT REP OEP-MURRELL-ETAL-2 S1 KCAL`	S^{-2} term of the above total term

Charge-Transfer Interaction Energy	

EFP2 Model	
`EINT CT EFP2 KCAL`	Total charge-transfer energy (kcal/mole)

Otto-Ladik Model	
`EINT CT OTTO-LADIK KCAL`	Total charge-transfer energy (kcal/mole)

OEP-Based Otto-Ladik Model	
`EINT CT OEP-OTTO-LADIK KCAL`	Total charge-transfer energy (kcal/mole)

EET Coupling Constant	

Keyword	Description
TrCAMM Model	
`EET V0 TRCAMM R1 CM-1`	Overlap-uncorrected, converged to R1 (cm-1)
`EET V TRCAMM R1 CM-1`	Overlap-corrected, converged to R1 (cm-1)
`EET V0 TRCAMM R2 CM-1`	Overlap-uncorrected, converged to R2 (cm-1)
`EET V TRCAMM R2 CM-1`	Overlap-corrected, converged to R2 (cm-1)
`EET V0 TRCAMM R3 CM-1`	Overlap-uncorrected, converged to R3 (cm-1)
`EET V TRCAMM R3 CM-1`	Overlap-corrected, converged to R3 (cm-1)
`EET V0 TRCAMM R4 CM-1`	Overlap-uncorrected, converged to R4 (cm-1)
`EET V TRCAMM R4 CM-1`	Overlap-corrected, converged to R4 (cm-1)
`EET V0 TRCAMM R5 CM-1`	Overlap-uncorrected, converged to R5 (cm-1)
`EET V TRCAMM R5 CM-1`	Overlap-corrected, converged to R5 (cm-1)
TI/CIS Model	
`EET V0 COUL CM-1`	Overlap-uncorrected Coulomb (Forster) coupling (cm-1)
`EET V0 EXCH CM-1`	Overlap-uncorrected exchange (Dexter) coupling (cm-1)
`EET V COUL CM-1`	Overlap-corrected Coulomb (Forster) coupling (cm-1)
`EET V EXCH CM-1`	Overlap-corrected exchange (Dexter) coupling (cm-1)
`EET V OVRL CM-1`	Remaining overlap correction to direct coupling(cm-1)
`EET V0 ET1 CM-1`	Overlap-uncorrected H_{13} matrix element (cm-1)
`EET V0 ET2 CM-1`	Overlap-uncorrected H_{24} matrix element (cm-1)
`EET V0 HT1 CM-1`	Overlap-uncorrected H_{14} matrix element (cm-1)
`EET V0 HT2 CM-1`	Overlap-uncorrected H_{23} matrix element (cm-1)
`EET V0 CT CM-1`	Overlap-uncorrected H_{34} matrix element (cm-1)
`EET V ET1 CM-1`	Overlap-corrected H_{13} matrix element (cm-1)
`EET V ET2 CM-1`	Overlap-corrected H_{24} matrix element (cm-1)
`EET V HT1 CM-1`	Overlap-corrected H_{14} matrix element (cm-1)
`EET V HT2 CM-1`	Overlap-corrected H_{23} matrix element (cm-1)

Keyword	Description
`EET V CT CM-1`	Overlap-corrected H_34 matrix element (cm-1)
`EET V0 TI-2 CM-1`	Approximate 2nd-order indirect coupling (cm-1)
`EET V0 TI-3 CM-1`	Approximate 3rd-order indirect coupling (cm-1)
`EET V TI-2 CM-1`	2nd-order indirect coupling (cm-1)
`EET V TI-3 CM-1`	3rd-order indirect coupling (cm-1)
`EET V0 DIRECT CM-1`	Approximate direct coupling (cm-1)
`EET V0 INDIRECT CM-1`	Approximate indirect coupling (cm-1)
`EET V DIRECT CM-1`	Direct coupling (cm-1)
`EET V INDIRECT CM-1`	Indirect coupling (cm-1)
`EET V0 TI-CIS CM-1`	Approximate total coupling (cm-1)
`EET V TI-CIS CM-1`	Total coupling (cm-1)
`EET V0 EXCH-M CM-1`	Overlap-uncorrected exchange (Dexter) coupling in Mulliken approximation (cm-1)
`EET V EXCH-M CM-1`	Overlap-corrected exchange (Dexter) coupling in Mulliken approximation (cm-1)
`EET V0 CT-M CM-1`	Overlap-uncorrected H_34 matrix element in Mulliken approximation (cm-1)
`EET V CT-M CM-1`	Overlap-corrected H_34 matrix element in Mulliken approximation (cm-1)
OEP-Based TI/CIS Model	
`EET V OEP:COUL CM-1`	Overlap-corrected Coulomb (Forster) coupling (TrCAMM; cm-1)
`EET V OEP:EXCH CM-1`	Overlap-corrected exchange (Dexter) coupling (Mulliken approximation of AO ERI's; cm-1)
`EET V OEP:OVRL CM-1`	Remaining overlap correction to direct coupling (cm-1)
`EET V0 OEP:ET1 CM-1`	Overlap-uncorrected H_13 matrix element (cm-1)
`EET V0 OEP:ET2 CM-1`	Overlap-uncorrected H_24 matrix element (cm-1)
`EET V0 OEP:HT1 CM-1`	Overlap-uncorrected H_14 matrix element (cm-1)
`EET V0 OEP:HT2 CM-1`	Overlap-uncorrected H_23 matrix element (cm-1)
`EET V0 OEP:CT:CAMM CM-1`	Overlap-uncorrected H_34 matrix element: CAMM approximation of ionic interaction (cm-1)

Keyword	Description
`EET V0 OEP:CT:CC CM-1`	Overlap-uncorrected H_34 matrix element: Point-charge approximation of ionic interaction (cm-1)
`EET V OEP:ET1 CM-1`	Overlap-corrected H_13 matrix element (cm-1)
`EET V OEP:ET2 CM-1`	Overlap-corrected H_24 matrix element (cm-1)
`EET V OEP:HT1 CM-1`	Overlap-corrected H_14 matrix element (cm-1)
`EET V OEP:HT2 CM-1`	Overlap-corrected H_23 matrix element (cm-1)
`EET V OEP:CT:`CAMM` CM-1`	Overlap-corrected H_34 matrix element: CAMM approximation of ionic interaction (cm-1)
`EET V OEP:CT:CC CM-1`	Overlap-corrected H_34 matrix element: Point-charge approximation of ionic interaction (cm-1)
`EET V OEP:TI-2 CM-1`	2nd-order indirect coupling (cm-1)
`EET V OEP:TI-3:`CAMM` CM-1`	3rd-order indirect coupling with CAMM approximation for V_CT (cm-1)
`EET V OEP:TI-3:CC CM-1`	3rd-order indirect coupling with point-charge approximation for V_CT (cm-1)
`EET V OEP:DIRECT CM-1`	Direct coupling (cm-1)
`EET V OEP:INDIRECT:`CAMM` CM-1`	Indirect coupling with CAMM approximation for V_CT (cm-1)
`EET V OEP:INDIRECT:CC CM-1`	Indirect coupling with point-charge approximation for V_CT (cm-1)
`EET V OEP:TI-CIS:`CAMM` CM-1`	Total coupling with CAMM approximation for V_CT (cm-1)
`EET V OEP:TI-CIS:CC CM-1`	Total coupling with point-charge approximation for V_CT (cm-1)

18.78.2 Constructor & Destructor Documentation

18.78.2.1 OEPDevSolver()

```
OEPDevSolver::OEPDevSolver (
        SharedWavefunctionUnion wfn_union )
```

Parameters

wfn_union	- wavefunction union of isolated molecular wavefunctions

18.78.3 Member Function Documentation

18.78.3.1 build()

```
std::shared_ptr< OEPDevSolver > OEPDevSolver::build (
            const std::string & target,
            SharedWavefunctionUnion wfn_union ) [static]
```

Parameters

target	- target property
wfn_union	- wavefunction union of isolated molecular wavefunctions

Implemented target properties:

- ELECTROSTATIC_ENERGY - Coulombic interaction energy between unperturbed wavefunctions.

- REPULSION_ENERGY - Pauli repulsion interaction energy between unperturbed wavefunctions.

See also

ElectrostaticEnergySolver

18.78.3.2 compute_benchmark()

```
double OEPDevSolver::compute_benchmark (
            const std::string & method = "DEFAULT" ) [pure virtual]
```

Each solver object has one DEFAULT benchmark method

Parameters

method	- benchmark method

Implemented in oepdev::EETCouplingSolver, oepdev::ChargeTransferEnergySolver, oepdev::RepulsionEnergyS
and oepdev::ElectrostaticEnergySolver.

18.78.3.3 compute_oep_based()

```
double OEPDevSolver::compute_oep_based (
        const std::string & method = "DEFAULT" ) [pure virtual]
```

Each solver object has one `DEFAULT` OEP-based method.

Parameters

method	- flavour of OEP model

Implemented in oepdev::EETCouplingSolver, oepdev::ChargeTransferEnergySolver, oepdev::RepulsionEnergyS and oepdev::ElectrostaticEnergySolver.

The documentation for this class was generated from the following files:

- oepdev/libsolver/solver.h
- oepdev/libsolver/solver_base.cc

18.79 oepdev::OEPotential Class Reference

Generalized One-Electron Potential: Abstract base.

```
#include <oep.h>
```

Inheritance diagram for oepdev::OEPotential:
Public Member Functions

- OEPotential (SharedWavefunction wfn, Options &options)

  Fully ESP-based OEP object.

- OEPotential (SharedWavefunction wfn, SharedBasisSet auxiliary, SharedBasisSet intermediate, Options &options)

  General OEP object.

- OEPotential (const OEPotential ∗)

  Copy constructor.

- virtual std::shared_ptr< OEPotential > clone (void) const =0

  Make a deep copy of this object.

- virtual ∼OEPotential ()

  Destructor.

- virtual void compute (void)

Compute matrix forms of all OEP's within all OEP types.

- virtual void compute (const std::string &oepType)=0

  Compute matrix forms of all OEP's within a specified OEP type.

- virtual void compute_3D (const std::string &oepType, const double &x, const double &y, const double &z, std::shared_ptr< psi::Vector > &v)=0

  Compute value of potential in point x, y, z and save at v.

- std::shared_ptr< OEPotential3D< OEPotential > > make_oeps3d (const std::string &oep-Type)

  Create 3D vector field with OEP.

- virtual void write_cube (const std::string &oepType, const std::string &fileName)

  Write potential to a cube file.

- virtual void localize (void)

  Localize Occupied MO's.

- virtual std::vector< psi::SharedVector > mo_centroids (psi::SharedMatrix C)

  Compute MO centroids from LCAO-MO matrix.

- virtual void rotate (psi::SharedMatrix r, psi::SharedMatrix R_prim, psi::SharedMatrix R_aux)

  Rotate.

- virtual void translate (psi::SharedVector t)

  Translate.

- virtual void superimpose (const Matrix &refGeometry, const std::vector< int > &supList, const std::vector< int > &reordList)

  Superimpose.

- std::string name () const

  Retrieve name of this OEP.

- OEPType oep (const std::string &oepType) const

  Retrieve the potentials.

- SharedMatrix matrix (const std::string &oepType) const

  Retrieve the potentials of a particular OEP type in a matrix form.

- int n (const std::string &oepType) const

  Retrieve the number of a particular OEP type.

- SharedWavefunction wfn () const

  Retrieve wavefunction object.

- SharedMatrix cOcc () const

  Retrieve Canonical occupied MOs.

- SharedMatrix cVir () const

  Retrieve Canonical virtual MOs.

- SharedVector epsOcc () const

  Retrieve Canonical occupied MO energies.

- SharedVector epsVir () const

  Retrieve Canonical virtual MO energies.

- SharedMatrix lOcc () const

  Retrieve Localized occupied MOs.
- SharedMatrix T () const

  Retrieve Canonical to Localized occupied MO transformation matrix.
- SharedLocalizer localizer () const

  Retrieve MO Localizer.
- std::vector< std::shared_ptr< psi::Vector > > lmoc () const

  Retrieve LMO Centroids.
- void set_name (const std::string &name)

  Set the name of this OEP.
- void set_localized_orbitals (std::shared_ptr< psi::Localizer > localizer)

  Set the localized molecular orbitals in OEP calculation.
- void set_localized_orbitals (std::shared_ptr< OEPotential > oep)

  Set the localized molecular orbitals in OEP calculation.
- void set_occupied_canonical_orbitals (std::shared_ptr< OEPotential > oep)

  Set the occupied canonical orbitals in OEP calculations.
- virtual void print_header () const

  Header information.
- void print () const

  Print the contents (OEP data)
- virtual void initialize ()=0

  Initialize the object (expert)

Static Public Member Functions

- static std::shared_ptr< OEPotential > build (const std::string &category, SharedWavefunction wfn, Options &options)

  Build fully ESP-based OEP object.
- static std::shared_ptr< OEPotential > build (const std::string &category, SharedWavefunction wfn, SharedBasisSet auxiliary, SharedBasisSet intermediate, Options &options)

  Build general OEP object.

Public Attributes

- bool use_localized_orbitals

  Whether to use localized molecular orbitals in OEP calculation; Default: False.
- bool use_quambo_orbitals

  Whether to use QUAMBO orbitals to construct VVOs; Default: False.

Protected Member Functions

- virtual void copy_from (const OEPotential ∗)

  Deep-copy the data.

- virtual void rotate_basic (psi::SharedMatrix r, psi::SharedMatrix R_prim, psi::SharedMatrix R_aux)

  Rotate basic data.

- virtual void translate_basic (psi::SharedVector t)

  Translate basic data.

- virtual void **rotate_oep** (psi::SharedMatrix r, psi::SharedMatrix R_prim, psi::SharedMatrix R_aux)

- virtual void **translate_oep** (psi::SharedVector t)

- virtual void compute_molecular_orbitals ()

  Compute MOs (used in initialization stage)

Protected Attributes

- Options options_

  Psi4 options.

- SharedWavefunction wfn_

  Wavefunction.

- SharedBasisSet primary_

  Promary Basis set.

- SharedBasisSet auxiliary_

  Auxiliary Basis set.

- SharedBasisSet intermediate_

  Intermediate Basis set.

- SharedLocalizer localizer_

  Molecular Orbital Localizer.

- std::string name_

  Name of this OEP;.

- std::map< std::string, OEPType > oepTypes_

  Types of OEP's within the scope of this object.

- std::shared_ptr< psi::IntegralFactory > intsFactory_

  Integral factory.

- psi::SharedMatrix potMat_

  Matrix of potential one-electron integrals.

- std::shared_ptr< psi::OneBodyAOInt > OEInt_

  One-electron integral shared pointer.

- std::shared_ptr< oepdev::PotentialInt > potInt_

  One-electron potential shared pointer.

- psi::SharedMatrix cOcc_

    Occupied orbitals: Canonical (CMO)

- psi::SharedMatrix cVir_

    Virtual orbitals (Canonical or Valence)

- psi::SharedVector epsOcc_

    Occupied orbital energies: Canonical (CMO)

- psi::SharedVector epsVir_

    Virtual orbital energies (Canonical or Valence)

- psi::SharedMatrix lOcc_

    Occupied orbitals: Localized (LMO)

- psi::SharedMatrix T_

    Canonical to Occupied orbitals transformation.

- std::vector< psi::SharedVector > lmoc_

    LMO Centroids.

- bool initialized_

    Is the object initialized? (MOs computed)

18.79.1   Detailed Description

Manages OEP's in matrix and 3D forms. Available OEP categories:

- ELECTROSTATIC ENERGY

- REPULSION ENERGY

- CHARGE TRANSFER ENERGY

- EET COUPLING CONSTANT

18.79.2   Constructor & Destructor Documentation

18.79.2.1   OEPotential() [1/2]

```
OEPotential::OEPotential (
        SharedWavefunction wfn,
        Options & options )
```

Parameters

wfn	- wavefunction
options	- Psi4 options

18.79.2.2 OEPotential() [2/2]

```
OEPotential::OEPotential (
        SharedWavefunction wfn,
        SharedBasisSet auxiliary,
        SharedBasisSet intermediate,
        Options & options )
```

Parameters

wfn	- wavefunction
auxiliary	- auxiliary basis set for density fitting of OEP's
intermediate	- intermediate basis set for density fitting of OEP's
options	- Psi4 options

18.79.3 Member Function Documentation

18.79.3.1 build() [1/2]

```
std::shared_ptr< OEPotential > OEPotential::build (
        const std::string & category,
        SharedWavefunction wfn,
        Options & options ) [static]
```

Parameters

type	- OEP category
wfn	- wavefunction
options	- Psi4 options

18.79.3.2 build() [2/2]

```
std::shared_ptr< OEPotential > OEPotential::build (
        const std::string & category,
        SharedWavefunction wfn,
        SharedBasisSet auxiliary,
        SharedBasisSet intermediate,
        Options & options ) [static]
```

Parameters

type	- OEP category
wfn	- wavefunction
auxiliary	- auxiliary basis set for density fitting of OEP's
intermediate	- intermediate basis set for density fitting of OEP's
options	- Psi4 options

18.79.3.3 make_oeps3d()

```
std::shared_ptr< OEPotential3D< OEPotential > > OEPotential::make_oeps3d (
          const std::string & oepType )
```

Parameters

oepType	- type of OEP. ESP-based OEP is assumed.

Returns

Vector field 3D with the OEP values.

The documentation for this class was generated from the following files:

- oepdev/liboep/oep.h
- oepdev/liboep/oep_base.cc

18.80 oepdev::OEPotential3D< T > Class Template Reference

Class template for OEP 3D fields.

```
#include <space3d.h>
```

Inheritance diagram for oepdev::OEPotential3D< T >:
Public Member Functions

- OEPotential3D (const int &ndim, const int &np, const double &padding, std::shared_ptr< T > oep, const std::string &oepType)

Construct random spherical collection of 3D field of type T.

- OEPotential3D (const int &ndim, const int &nx, const int &ny, const int &nz, const double &px, const double &py, const double &pz, std::shared_ptr< T > oep, const std::string &oepType, psi::Options &options)

  Construct ordered 3D collection of 3D field of type T.

- virtual ∼OEPotential3D ()

  Destructor.

- virtual std::shared_ptr< psi::Vector > compute_xyz (const double &x, const double &y, const double &z)

  Compute a value of 3D field at point (x, y, z)

- virtual void print () const

  Print information of the object to Psi4 output.

Protected Attributes

- std::shared_ptr< T > oep_

  Shared pointer to the instance of class T

- std::string oepType_

  Descriptor of the 3D field type stored in instance of T

Additional Inherited Members

18.80.1   Detailed Description

template<**class T**>
class oepdev::OEPotential3D< **T** >

Used for special type of classes T that contain following public member functions:

```
class T : public std::enable_shared_from_this<T> {

  public:
    void compute_3D(const std::string& descriptor,
                    const double& x, const double& y, const double& z,
                    std::shared_ptr<psi::Vector> &v);

    shared_ptr<psi::Wavefunction> wfn() const {return wfn_;}

};
```

with the `descriptor` of a certain 3D field type, `x`, `y`, `z` the points in 3D space in which the scalar or vector field has to be computed and stored at `v`. Instances of `T` should store shared pointer to wavefunction object. List of classes `T` that are compatible with this class template and are currently implemented in oepdev is given below:

- `oepdev::OEPotential` abstract base (do not use derived classes as `T`)

Template parameters:

Template Parameters

T	the compatible class (e.g. `oepdev::OEPotential`)

The documentation for this class was generated from the following file:

- oepdev/lib3d/space3d.h

18.81 oepdev::OEPType Struct Reference

Container to handle the type of One-Electron Potentials.

`#include <oep.h>`

Public Member Functions

- OEPType ()=default

  Initializer.

- OEPType (std::string, bool, int, SharedMatrix, SharedDMTPole, SharedCISData)

  Initializer from list.

- OEPType (const OEPType ∗)

  Copy constructor.

Public Attributes

- std::string name

  Name of this type of OEP.

- bool is_density_fitted

  Is this OEP DF-based?

- int n

  Number of OEP's within a type.

- SharedMatrix matrix

  All OEP's of this type gathered in a matrix form.

- SharedDMTPole dmtp

  Distributed Multipole Object.

- SharedCISData cis_data

  CIS data.

The documentation for this struct was generated from the following files:

- oepdev/liboep/oep.h
- oepdev/liboep/oep_base.cc

18.82 oepdev::OverlapGeneralizedDensityFit Class Reference

Generalized Density Fitting Scheme - Single Fit Based on Minimal Overlap in MO Basis.

```
#include <oep_gdf.h>
```

Inheritance diagram for oepdev::OverlapGeneralizedDensityFit:
Public Member Functions

- **OverlapGeneralizedDensityFit** (std::shared_ptr< psi::BasisSet > bs_auxiliary, std::shared_ptr< psi::BasisSet > bs_intermediate, std::shared_ptr< psi::Matrix > v_vector)
- std::shared_ptr< psi::Matrix > compute (void)

    Perform the generalized density fit.

Additional Inherited Members

18.82.1 Detailed Description

The density fitting map projects the OEP onto an arbitrary (not necessarily complete) auxiliary basis set space through application of the basis projection technique. Refer to density fitting specialized for OEP's for more details.

18.82.2 Determination of the OEP matrix

Coefficients $\mathbf{G}$ are computed by using the following relation

$$\mathbf{G} = \mathbf{T}_{m\tilde{B}} \cdot \mathbf{S}_{\tilde{B}\tilde{B}}^{-1} \cdot \mathbf{T}_{m\tilde{B}}^{\dagger} \cdot \mathbf{S}_{mi} \cdot \mathbf{G}_i$$

where the intermediate projection matrix is given by

$$\mathbf{G}_i = \mathbf{S}_{ii}^{-1} \cdot \mathbf{V}_i$$

In the above equations, TODO

The spatial form of the potential operator $\hat{v}$ can be expressed by

$$v(\mathbf{r}) \equiv \int d\mathbf{r}' \frac{\rho(\mathbf{r}')}{|\mathbf{r}' - \mathbf{r}|}$$

with $\rho(\mathbf{r})$ being the effective one-electron density associated with $\hat{v}$.

18.82.3 Member Function Documentation

18.82.3.1 compute()

```
std::shared_ptr< psi::Matrix > OverlapGeneralizedDensityFit::compute (
            void ) [virtual]
```

Returns

The OEP coefficients $G_{\xi i}$

Implements oepdev::GeneralizedDensityFit.

The documentation for this class was generated from the following files:

- oepdev/liboep/oep_gdf.h
- oepdev/liboep/oep_gdf.cc

18.83 oepdev::PerturbCharges Struct Reference

Structure to hold perturbing charges.

```
#include <scf_perturb.h>
```

Public Attributes

- std::vector< double > charges

    Vector of charge values.
- std::vector< std::shared_ptr< psi::Vector > > positions

    Vector of charge position vectors.

18.83.1 Detailed Description

The documentation for this struct was generated from the following file:

- oepdev/libutil/scf_perturb.h

18.84 oepdev::Points3DIterator::Point Struct Reference

Public Attributes

- double **x**

- double **y**
- double **z**
- int **index**

The documentation for this struct was generated from the following file:

- oepdev/lib3d/space3d.h

18.85 oepdev::Points3DIterator Class Reference

Iterator over a collection of points in 3D space. Abstract base.

```
#include <space3d.h>
```

Inheritance diagram for oepdev::Points3DIterator:

```
┌─────────────────────────────┐
│   oepdev::Points3DIterator  │
└─────────────────────────────┘
          ▲

│ oepdev::CubePoints3DIterator │  │ oepdev::RandomPoints3DIterator │
└──────────────────────────────┘  └────────────────────────────────┘
```
Classes

- struct Point

Public Member Functions

- Points3DIterator (const int &np)

    Plain constructor. Initializes the abstract features.
- virtual ∼Points3DIterator ()

    Destructor.
- virtual bool is_done ()

    Check if iteration is finished.
- virtual void first ()=0

    Initialize first iteration.
- virtual void next ()=0

    Step to next iteration.
- virtual void rewind ()

    Rewind to the beginning.

- virtual double **x** () const
- virtual double **y** () const
- virtual double **z** () const
- virtual int **index** () const

Static Public Member Functions

- static shared_ptr< Points3DIterator > build (const int &nx, const int &ny, const int &nz, const double &dx, const double &dy, const double &dz, const double &ox, const double &oy, const double &oz)

    Build G09 Cube collection iterator.
- static shared_ptr< Points3DIterator > build (const int &np, const double &radius, const double &cx, const double &cy, const double &cz)

    Build random collection iterator.
- static shared_ptr< Points3DIterator > build (const int &np, const double &pad, psi::SharedMolecule mol)

    Build random collection iterator.

Protected Attributes

- const int np_

    Number of points.
- bool done_

    Status of the iterator.
- int index_

    Current index.

- Point **current_**

18.85.1 Detailed Description

Points3DIterators are constructed either as iterators over:

- a random collections or

- an ordered (g09 cube-like) collections. **Note:** Always create instances by using static factory methods.

18.85.2 Constructor & Destructor Documentation

18.85.2.1 Points3DIterator()

```
oepdev::Points3DIterator::Points3DIterator (
          const int & np )
```

Parameters

np	- number of points this iterator is constructed for

18.85.3 Member Function Documentation

18.85.3.1 build() [1/3]

```
std::shared_ptr< Points3DIterator > oepdev::Points3DIterator::build (
          const int & nx,
          const int & ny,
          const int & nz,
          const double & dx,
          const double & dy,
          const double & dz,
          const double & ox,
          const double & oy,
          const double & oz ) [static]
```

The points are generated according to Gaussian cube file format.

Parameters

nx	- number of points along x direction
ny	- number of points along y direction
nz	- number of points along z direction
dx	- spacing distance along x direction
dy	- spacing distance along y direction
dz	- spacing distance along y direction
ox	- coordinate x of cube origin
oy	- coordinate y of cube origin
oz	- coordinate z of cube origin

18.85.3.2 build() [2/3]

```
std::shared_ptr< Points3DIterator > oepdev::Points3DIterator::build (
```

```
        const int & np,
        const double & radius,
        const double & cx,
        const double & cy,
        const double & cz ) [static]
```

The points are drawn according to uniform distrinution in 3D space.

Parameters

np	- number of points to draw
radius	- sphere radius inside which points are to be drawn
cx	- coordinate x of sphere's centre
cy	- coordinate y of sphere's centre
cz	- coordinate z of sphere's centre

18.85.3.3 build() [3/3]

```
shared_ptr< Points3DIterator > oepdev::Points3DIterator::build (
        const int & np,
        const double & pad,
        psi::SharedMolecule mol ) [static]
```

The points are drawn according to uniform distrinution in 3D space enclosing a molecule given. All drawn points lie outside the van der Waals volume.

Parameters

np	- number of points to draw
pad	- radius padding of a minimal sphere enclosing the molecule
mol	- Psi4 molecule object

The documentation for this class was generated from the following files:

- oepdev/lib3d/space3d.h
- oepdev/lib3d/space3d.cc

18.86 oepdev::PointsCollection3D Class Reference

Collection of points in 3D space. Abstract base.

```
#include <space3d.h>
```

Inheritance diagram for oepdev::PointsCollection3D:

```
                          ┌──────────────────────────────┐

                          └──────────────────────────────┘
                                        ▲
                          ┌─────────────┴──────────────┐
          ┌──────────────────────────────┐  ┌──────────────────────────────────┐
          │ oepdev::CubePointsCollection3D │  │ oepdev::RandomPointsCollection3D │
          └──────────────────────────────┘  └──────────────────────────────────┘
```

Public Types

- enum Collection { **Random**, **Cube** }

    Public descriptior of collection type.

Public Member Functions

- PointsCollection3D (Collection collectionType, int &np)

    Initialize abstract features.

- **PointsCollection3D** (Collection collectionType, const int &np)
- virtual ∼PointsCollection3D ()

    Destructor.

- virtual int npoints () const

    Get the number of points.

- virtual shared_ptr< Points3DIterator > points_iterator () const

    Get the iterator over this collection of points.

- virtual Collection get_type () const

    Get the collection type.

- virtual void print () const =0

    Print the information to Psi4 output file.

Static Public Member Functions

- static shared_ptr< PointsCollection3D > build (const int &npoints, const double &radius, const double &cx=0.0, const double &cy=0.0, const double &cz=0.0)

    Build random collection of points.

- static shared_ptr< PointsCollection3D > build (const int &npoints, const double &padding, psi::SharedMolecule mol)

    Build random collection of points.

- static shared_ptr< PointsCollection3D > build (const int &nx, const int &ny, const int &nz, const double &px, const double &py, const double &pz, psi::SharedBasisSet bs, psi::Options &options)

    Build G09 Cube collection of points.

Protected Attributes

- const int np_

    Number of points.

- Collection collectionType_

    Collection type.

- shared_ptr< Points3DIterator > pointsIterator_

    iterator over points collection

18.86.1   Detailed Description

Create random or ordered (g09 cube-like) collections of points in 3D space.

Note: Always create instances by using static factory methods.

18.86.2   Constructor & Destructor Documentation

18.86.2.1   PointsCollection3D()

```
oepdev::PointsCollection3D::PointsCollection3D (
        Collection collectionType,
        int & np )
```

Parameters

np	- number of points to be created

18.86.3   Member Function Documentation

18.86.3.1   build() [1/3]

```
std::shared_ptr< PointsCollection3D > oepdev::PointsCollection3D::build (
        const int & npoints,
        const double & radius,
        const double & cx = 0.0,
        const double & cy = 0.0,
        const double & cz = 0.0 ) [static]
```

Points uniformly span a sphere.

Parameters

npoints	- number of points to draw
radius	- sphere radius inside which points are to be drawn
cx	- coordinate x of sphere's centre
cy	- coordinate y of sphere's centre
cz	- coordinate z of sphere's centre

18.86.3.2 build() [2/3]

```
std::shared_ptr< PointsCollection3D > oepdev::PointsCollection3D::build (
          const int & npoints,
          const double & padding,
          psi::SharedMolecule mol ) [static]
```

Points uniformly span space inside a sphere enclosing a molecule. exluding the van der Waals volume.

Parameters

np	- number of points to draw
padding	- radius padding of a minimal sphere enclosing the molecule
mol	- Psi4 molecule object

18.86.3.3 build() [3/3]

```
std::shared_ptr< PointsCollection3D > oepdev::PointsCollection3D::build (
          const int & nx,
          const int & ny,
          const int & nz,
          const double & px,
          const double & py,
          const double & pz,
          psi::SharedBasisSet bs,
          psi::Options & options ) [static]
```

The points span a parallelpiped according to Gaussian cube file format.

Parameters

nx	- number of points along x direction
ny	- number of points along y direction
nz	- number of points along z direction

Parameters

px	- padding distance along x direction
py	- padding distance along y direction
pz	- padding distance along z direction
bs	- Psi4 basis set object
options	- Psi4 options object

The documentation for this class was generated from the following files:

- oepdev/lib3d/space3d.h

18.87   oepdev::PolarGEFactory Class Reference

Polarization GEFP Factory. Abstract Base.

```
#include <gefp.h>
```

Inheritance diagram for oepdev::PolarGEFactory:

Public Member Functions

- PolarGEFactory (std::shared_ptr< psi::Wavefunction > wfn, psi::Options &opt)

    Construct from Psi4 options.

- virtual ∼PolarGEFactory ()

    Destruct.

- virtual std::shared_ptr< GenEffPar > compute (void)=0

    Compute the density matrix susceptibility tensors.

Protected Member Functions

- std::shared_ptr< psi::Vector > draw_field ()

    Randomly draw electric field value.

- double draw_charge ()

    Randomly draw charge value.

- std::shared_ptr< oepdev::RHFPerturbed > perturbed_state (const std::shared_ptr< psi::Vector > &field)

    Solve SCF equations to find perturbed state due to uniform electric field.

- std::shared_ptr< oepdev::RHFPerturbed > perturbed_state (const std::shared_ptr< psi::Vector > &pos, const double &charge)

  Solve SCF equations to find perturbed state due to point charge.

- std::shared_ptr< oepdev::RHFPerturbed > perturbed_state (const std::shared_ptr< psi::Matrix > &charges)

  Solve SCF equations to find perturbed state due to set of point charges.

- std::shared_ptr< psi::Vector > field_due_to_charges (const std::shared_ptr< psi::Matrix > &charges, const double &x, const double &y, const double &z)

  Evaluate electric field at point (x,y,z) due to point charges.

- std::shared_ptr< psi::Vector > **field_due_to_charges** (const std::shared_ptr< psi::Matrix > &charges, const std::shared_ptr< psi::Vector > &pos)

- std::shared_ptr< psi::Matrix > field_gradient_due_to_charges (const std::shared_ptr< psi::Matrix > &charges, const double &x, const double &y, const double &z)

  Evaluate electric field gradient at point (x,y,z) due to point charges.

- std::shared_ptr< psi::Matrix > **field_gradient_due_to_charges** (const std::shared_ptr< psi::Matrix > &charges, const std::shared_ptr< psi::Vector > &pos)

Additional Inherited Members

18.87.1 Detailed Description

Basic interface for the polarization density matrix susceptibility parameters.

The documentation for this class was generated from the following files:

- oepdev/libgefp/gefp.h
- oepdev/libgefp/gefp_polar_base.cc

18.88 oepdev::PotentialInt Class Reference

Computes potential integrals.

```
#include <potential.h>
```

Inheritance diagram for oepdev::PotentialInt:

Public Member Functions

- PotentialInt (std::vector< psi::SphericalTransform > &st, std::shared_ptr< psi::BasisSet > bs1, std::shared_ptr< psi::BasisSet > bs2, int deriv=0)

Constructor. Initialize identically like in psi::PotentiIInt.

- PotentialInt (std::vector< psi::SphericalTransform > &st, std::shared_ptr< psi::BasisSet > bs1, std::shared_ptr< psi::BasisSet > bs2, std::shared_ptr< psi::Matrix > Qxyz, int deriv=0)

Constructor. Takes an arbitrary collection of charges.

- PotentialInt (std::vector< psi::SphericalTransform > &, std::shared_ptr< psi::BasisSet >, std::shared_ptr< psi::BasisSet >, const double &x, const double &y, const double &z, const double &q=1.0, int deriv=0)

Constructor. Computes potential for one point x, y, z for a test particle of charge q.

- void set_charge_field (const double &x, const double &y, const double &z, const double &q=1.0)

Mutator. Set the charge field to be a x, y, z point of charge q.

18.88.1 Constructor & Destructor Documentation

18.88.1.1 PotentialInt() [1/3]

```
oepdev::PotentialInt::PotentialInt (
        std::vector< psi::SphericalTransform > & st,
        std::shared_ptr< psi::BasisSet > bs1,
        std::shared_ptr< psi::BasisSet > bs2,
        int deriv = 0 )
```

Parameters

st	- Spherical transform object
bs1	- basis set for first space
bs2	- basis set for second space
deriv	- derivative level

18.88.1.2 PotentialInt() [2/3]

```
oepdev::PotentialInt::PotentialInt (
        std::vector< psi::SphericalTransform > & st,
        std::shared_ptr< psi::BasisSet > bs1,
        std::shared_ptr< psi::BasisSet > bs2,
        std::shared_ptr< psi::Matrix > Qxyz,
        int deriv = 0 )
```

Parameters

st	- Spherical transform object
bs1	- basis set for first space
bs2	- basis set for second space
Qxyz	- matrix with charges and their positions
deriv	- derivative level

18.88.1.3 PotentialInt() [3/3]

```
oepdev::PotentialInt::PotentialInt (
        std::vector< psi::SphericalTransform > & st,
        std::shared_ptr< psi::BasisSet > bs1,
        std::shared_ptr< psi::BasisSet > bs2,
        const double & x,
        const double & y,
        const double & z,
        const double & q = 1.0,
        int deriv = 0 )
```

Parameters

st	- Spherical transform object
bs1	- basis set for first space
bs2	- basis set for second space
x	- x coordinate of q
y	- y coordinate of q
z	- z coordinate of q
q	- value of the probe charge
deriv	- derivative level

18.88.2 Member Function Documentation

18.88.2.1 set_charge_field()

```
void oepdev::PotentialInt::set_charge_field (
        const double & x,
        const double & y,
        const double & z,
        const double & q = 1.0 )
```
Parameters

x	- x coordinate of q
y	- y coordinate of q
z	- z coordinate of q
q	- value of the probe charge

18.94.1 Detailed Description

```
Quasiatomic Minimal Basis Set Molecular Orbitals

Usage:

solve = QUAMBO(molecule, psi4.core.get_options(), acbs=False)
solve.compute()
c_vir = solve.mo(space='vir')
e_all = solve.eps(space='all')
quambo_b_nonorthogonal = solve.quambo(type='nonorthogonal', spin='beta')

Notes:
o first argument to QUAMBO constructor can also be Wavefunction object
  with the SCF solution of a molecule. In this case, SCF is not run
  for the molecule.

18.98.1 Detailed Description

Associated options:

- `CIS_TYPE` - must be set to `DAVIDSON_LIU` (Default).

- `CIS_SCHWARTZ_CUTOFF` - Cutoff for Schwartz ERI screening. Default: 0.0.

Implementation

Diagonal Hamiltonian elements

They are computed by using direct method with Schwartz screening of AO ERI's. The implementation formula is

$$H_{ii}^{aa} = \varepsilon_a - \varepsilon_i + \sum_{\alpha\beta\gamma\delta} (\alpha\beta|\gamma\delta) C_{\alpha i} C_{\delta a} \left(C_{\beta a} C_{\gamma i} - C_{\beta i} C_{\gamma a} \right)$$

The block associated with beta spin is equal to alpha block.

Sigma vectors

The sigma vectors are computed from

$$\sigma_i^{a,k} = (\varepsilon_a - \varepsilon_i) b_i^{a,k} + J_i^a(\mathbf{T}^{(k)}) + J_i^a(\overline{\mathbf{T}^{(k)}}) - K_i^a(\mathbf{T}^{(k)})$$
$$\sigma_{\bar{i}}^{\bar{a},k} = (\varepsilon_a - \varepsilon_i) b_{\bar{i}}^{\bar{a},k} + J_i^a(\mathbf{T}^{(k)}) + J_i^a(\overline{\mathbf{T}^{(k)}}) - K_i^a(\overline{\mathbf{T}^{(k)}})$$

where *k* labels the vectors and where the generalized one-particle density matrices are defined by

$$T_{\gamma\delta}^{(k)} = \sum_{jb} C_{\delta b} b_j^{b,k} C_{\gamma j}$$
$$\overline{T}_{\gamma\delta}^{(k)} = \sum_{\bar{j}\bar{b}} C_{\delta\bar{b}} b_{\bar{j}}^{\bar{b},k} C_{\gamma\bar{j}}$$
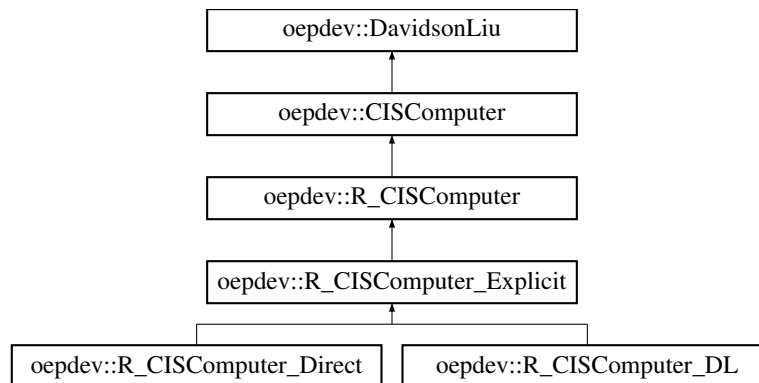

The **J** and **K** matrices in AO basis are computed by using the `psi::JK` object, and subsequently transformed to CMO's.

18.104.1   Detailed Description

The implemented methods are shown below

Table 18.118: Methods available in the Solver

Keyword	Method Description
Benchmark Methods	
`HAYES_STONE`	*Default*. Pauli Repulsion energy at HF level from Hayes and Stone (1984).
`DDS`	Pauli Repulsion energy at HF level from Mandado and Hermida-Ramon (2012).
`MURRELL_ETAL`	Approximate Pauli Repulsion energy at HF level from Murrell et al (1967).
`OTTO_LADIK`	Approximate Pauli Repulsion energy at HF level from Otto and Ladik (1975).
`EFP2`	Approximate Pauli Repulsion energy at HF level from EFP2 model.
OEP-Based Methods	
`MURRELL_ETAL_GDF_ESP`	*Default*. OEP-Murrell et al's: S1 term via DF-OEP, S2 term via ESP-OEP.
`MURRELL_ETAL_GDF_CAMM`	OEP-Murrell et al's: S1 term via DF-OEP, S2 term via CAMM-OEP.
`MURRELL_ETAL_ESP`	OEP-Murrell et al's: S1 and S2 via ESP-OEP (not implemented)

Note:

- This solver also computes and prints the exchange energy at HF level (formulae are given below) for reference purposes.

- In order to construct this solver, **always** use the `OEPDevSolver::build` static factory method.

Below the detailed description of the implemented equations is given for each of the above provided methods. In the formulae across, it is assumed that the orbitals are real. The Coulomb notation for electron repulsion integrals (ERI's) is adopted; i.e,

$$(ac|bd) = \iint d\mathbf{r}_1 d\mathbf{r}_2 \phi_a(\mathbf{r}_1)\phi_c(\mathbf{r}_1)\frac{1}{r_{12}}\phi_b(\mathbf{r}_2)\phi_d(\mathbf{r}_2)$$

Greek subscripts denote basis set orbitals whereas Italic subscripts denote the occupied molecular orbitals.

Benchmark Methods

Pauli Repulsion energy at HF level by Hayes and Stone (1984).

For a closed-shell system, equation of Hayes and Stone (1984) becomes

$$E^{\text{Rep}} = 2\sum_{kl} \left(V^A_{kl} + V^B_{kl} + T_{kl} \right) \left[[\mathbf{S}^{-1}]_{lk} - \delta_{lk} \right] + \sum_{klmn} (kl|mn) \left\{ 2[\mathbf{S}^{-1}]_{kl}[\mathbf{S}^{-1}]_{mn} - [\mathbf{S}^{-1}]_{kn}[\mathbf{S}^{-1}]_{lm} - 2\delta_{kl}\delta_{mn} + \delta_{kn}\delta_{lm} \right\}$$

where $\mathbf{S}$ is the overlap matrix between the doubly-occupied orbitals. The exact, pure exchange energy is for a closed shell case given as

$$E^{\text{Ex,pure}} = -2 \sum_{a \in A} \sum_{b \in B} (ab|ba)$$

Similarity transformation of molecular orbitals does not affect the resulting energies. The overall exchange-repulsion interaction energy is then (always net repulsive)

$$E^{\text{Ex-Rep}} = E^{\text{Ex,pure}} + E^{\text{Rep}}$$

Repulsion energy of Mandado and Hermida-Ramon (2011)

At the Hartree-Fock level, the exchange-repulsion energy from the density-based scheme of Mandado and Hermida-Ramon (2011) is fully equivalent to the method by Hayes and Stone (1984). However, density-based method enables to compute exchange-repulsion energy at any level of theory. It is derived based on the Pauli deformation density matrix,

$$\Delta \mathbf{D}^{\text{Pauli}} \equiv \mathbf{D}^{oo} - \mathbf{D}$$

where $\mathbf{D}^{oo}$ and $\mathbf{D}$ are the density matrix formed from mutually orthogonal sets of molecular orbitals within the entire aggregate (formed by symmetric orthogonalization of MO's) and the density matrix of the unperturbed system (that can be understood as a Hadamard sum $\mathbf{D} \equiv \mathbf{D}^A \oplus \mathbf{D}^B$).

At HF level, the Pauli deformation density matrix is given by

$$\Delta \mathbf{D}^{\text{Pauli}} = \mathbf{C} \left[\mathbf{S}^{-1} - \mathbf{1} \right] \mathbf{C}^\dagger$$

whereas the density matrix constructed from mutually orthogonal orbitals is

$$\mathbf{D}^{oo} = \mathbf{C}\mathbf{S}^{-1}\mathbf{C}^\dagger$$

In the above equations, $\mathbf{S}$ is the overlap matrix between doubly occupied molecular orbitals of the entire aggregate.

Here, the expressions for the exchange-repulsion energy at any level of theory are shown for the case of open-shell system. The net repulsive energy is given as

$$E^{\text{Ex-Rep}} = E^{\text{Rep,1}} + E^{\text{Rep,2}} + E^{\text{Ex}}$$

where the one- and two-electron part of the repulsion energy is

$$E^{\text{Rep,1}} = E^{\text{Rep,Kin}} + E^{\text{Rep,Nuc}}$$
$$E^{\text{Rep,2}} = E^{\text{Rep,el}-\Delta} + E^{\text{Rep,}\Delta-\Delta}$$

The kinetic and nuclear contributions are

$$E^{\text{Rep,Kin}} = 2 \sum_{\alpha\beta \in A,B} \Delta D^{\text{Pauli}}_{\alpha\beta} T_{\alpha\beta}$$

$$E^{\text{Rep,Nuc}} = 2 \sum_{\alpha\beta \in A,B} \Delta D^{\text{Pauli}}_{\alpha\beta} \sum_{z \in A,B} V^{(z)}_{\alpha\beta}$$

whereas the electron-deformation and deformation-deformation interaction contributions are

$$E^{\text{Rep,el}-\Delta} = 4 \sum_{\alpha\beta\gamma\delta \in A,B} \Delta D^{\text{Pauli}}_{\alpha\beta} D_{\gamma\delta} (\alpha\beta|\gamma\delta)$$

$$E^{\text{Rep},\Delta-\Delta} = 2 \sum_{\alpha\beta\gamma\delta \in A,B} \Delta D^{\text{Pauli}}_{\alpha\beta} \Delta D^{\text{Pauli}}_{\gamma\delta} (\alpha\beta|\gamma\delta)$$

The associated exchange energy is given by

$$E^{\text{Ex}} = - \sum_{\alpha\beta\gamma\delta \in A,B} \left[D^{oo}_{\alpha\delta} D^{oo}_{\beta\gamma} - D^{A}_{\alpha\delta} D^{A}_{\beta\gamma} - D^{B}_{\alpha\delta} D^{B}_{\beta\gamma} \right] (\alpha\beta|\gamma\delta)$$

It is important to emphasise that, although, at HF level, the particular 'repulsive' and 'exchange' energies computed by using either Hayes and Stone or Mandado and Hermida-Ramon methods are not equal to each other, they sum up to exactly the same exchange-repulsion energy, $E^{\text{Ex}-\text{Rep}}$. Therefore, these methods at HF level are fully equivalent but the nature of partitioning of repulsive and exchange parts is different. It is also noted that the orbital localization does *not* affect the resulting energies, as opposed to the few approximate methods described below (Otto-Ladik and EFP2 methods).

Approximate Pauli Repulsion energy at HF level from Murrell et al.

By expanding the overlap matrix in a Taylor series one can show that the Pauli repulsion energy is approximately given as

$$E^{\text{Rep}} = E^{\text{Rep}}(\mathscr{O}(S)) + E^{\text{Rep}}(\mathscr{O}(S^2))$$

where the first-order term is

$$E^{\text{Rep}}(\mathscr{O}(S)) = -2 \sum_{a \in A} \sum_{b \in B} S_{ab} \left\{ V^{A}_{ab} + \sum_{c \in A} [2(ab|cc) - (ac|bc)] + V^{B}_{ab} + \sum_{d \in B} [2(ab|dd) - (ad|bd)] \right\}$$

whereas the second-order term is

$$E^{\text{Rep}}(\mathscr{O}(S^2)) = 2 \sum_{a \in A} \sum_{b \in B} S_{ab} \left\{ \sum_{c \in A} S_{bc} \left[V^{B}_{ac} + 2 \sum_{d \in B} (ac|dd) \right] + \sum_{d \in B} S_{ad} \left[V^{A}_{bd} + 2 \sum_{x \in A} (bd|cc) \right] - \sum_{c \in A} \sum_{d \in B} S_{cd}(ac|bd) \right.$$

Thus derived repulsion energy is invariant with respect to transformation of molecular orbitals, similarly as Hayes-Stone's method and density-based method. By using OEP technique, the above theory can be exactly re-cast *without* any further approximations.

Approximate Pauli Repulsion energy at HF level from Otto and Ladik (1975).

The Pauli repulsion energy is approximately given as

$$E^{\text{Rep}} = E^{\text{Rep}}(\mathscr{O}(S)) + E^{\text{Rep}}(\mathscr{O}(S^2))$$

where the first-order term is

$$E^{\text{Rep}}(\mathscr{O}(S)) = -2 \sum_{a \in A} \sum_{b \in B} S_{ab} \left\{ V_{ab}^A + 2 \sum_{c \in A} (ab|cc) - (ab|aa) + V_{ab}^B + 2 \sum_{d \in B} (ab|dd) - (ab|bb) \right\}$$

whereas the second-order term is

$$E^{\text{Rep}}(\mathscr{O}(S^2)) = 2 \sum_{a \in A} \sum_{b \in B} S_{ab}^2 \left\{ V_{aa}^B + V_{bb}^A + 2 \sum_{c \in A} (cc|bb) + 2 \sum_{d \in B} (aa|dd) - (aa|bb) \right\}$$

Thus derived repulsion energy is *not* invariant with respect to transformation of molecular orbitals, in contrast to Hayes-Stone's method and density-based method. It was shown that good results are obtained when using localized molecular orbitals, whereas using canonical molecular orbitals brings poor results. By using OEP technique, the above theory can be exactly re-cast *without* any further approximations.

Approximate Pauli Repulsion energy at HF level from Jensen and Gordon (1996).

The Pauli repulsion energy used within the EFP2 approach is approximately given as

$$E^{\text{Rep}} = E^{\text{Rep}}(\mathscr{O}(S)) + E^{\text{Rep}}(\mathscr{O}(S^2))$$

where the first-order term is

$$E^{\text{Rep}}(\mathscr{O}(S)) = -2 \sum_{a \in A} \sum_{b \in B} S_{ab} \left\{ \sum_{c \in A} F_{ac}^A S_{cb} + \sum_{d \in B} F_{bd}^B S_{da} - 2T_{ab} \right\}$$

whereas the second-order term is

$$E^{\text{Rep}}(\mathscr{O}(S^2)) = 2 \sum_{a \in A} \sum_{b \in B} S_{ab}^2 \left\{ \sum_{x \in A} \frac{-Z_x}{R_{xb}} + \sum_{y \in B} \frac{-Z_y}{R_{ya}} + \sum_{c \in A} \frac{2}{R_{bc}} + \sum_{d \in B} \frac{2}{R_{ad}} - \frac{1}{R_{ab}} \right\}$$

Thus derived repulsion energy is *not* invariant with respect to transformation of molecular orbitals, in contrast to Hayes-Stone's method and density-based method. It was shown that good results are obtained when using localized molecular orbitals, whereas using canonical molecular orbitals brings poor results.

In EFP2, exchange energy is approximated by spherical Gaussian approximation (SGO). The result of this is the following formula for the exchange energy:

$$E^{\text{Ex}} \approx -4 \sum_{a \in A} \sum_{b \in B} \sqrt{\frac{-2 \ln |S_{ab}|}{\pi}} \frac{S_{ab}^2}{R_{ab}}$$

In all the above formulas, R_{ij} are distances between position vectors of *i*th and *j*th point. The LMO centroids are defined by

$$\mathbf{r}_a = (a|\mathbf{r}|a)$$

where *a* denotes the occupied molecular orbital.

OEP-Based Methods

The Murrell et al's theory of Pauli repulsion for S-1 term and the Otto-Ladik's theory for S-2 term is here re-cast by introducing OEP's. The S-1 term is expressed via DF-OEP, whereas the S-2 term via ESP-OEP.

S-1 term (Murrell et al.)

The OEP reduction without any approximations leads to the following formula

$$
E^{\mathrm{Rep}}(\mathscr{O}(S^1)) = -2 \sum_{a \in A} \sum_{b \in B} S_{ab} \left\{ \sum_{\xi \in A} S_{b\xi} G^A_{\xi a} + \sum_{\eta \in B} S_{a\eta} G^B_{\eta b} \right\}
$$

where the OEP matrices are given as

$$
G^A_{\xi a} = \sum_{\xi' \in A} [\mathbf{S}^{-1}]_{\xi \xi'} \sum_{\alpha \in A} \left\{ C_{\alpha a} V^A_{\alpha \xi'} + \sum_{\mu \nu \in A} \left[2 C_{\alpha a} D_{\mu \nu} - C_{\nu a} D_{\alpha \mu} \right] (\alpha \xi' | \mu \nu) \right\}
$$

and analogously for molecule B. Here, the nuclear attraction integrals are denoted by $V^A_{\alpha \xi'}$.

S-2 term (Otto-Ladik)

After the OEP reduction, this contribution under Otto-Ladik approximation has the following form:

$$
E^{\mathrm{Rep}}(\mathscr{O}(S^2)) = 2 \sum_{a \in A} \sum_{b \in B} S^2_{ab} \left\{ \sum_{x \in A} q_{xa} V^{(x)}_{bb} + \sum_{y \in B} q_{yb} V^{(y)}_{aa} \right\}
$$

where the ESP charges associated with each occupied molecular orbital reproduce the *effective potential* of molecule in question, i.e.,

$$
\sum_{x \in A} \frac{q_{xa}}{|\mathbf{r} - \mathbf{r}_x|} \cong v^A_a(\mathbf{r})
$$

where the potential is given by

$$
v^A_a(\mathbf{r}) = \sum_{x \in A} \frac{-Z_x}{|\mathbf{r} - \mathbf{r}_x|} + 2 \sum_{c \in A} \int \frac{\phi_c(\mathbf{r}')\phi_c(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} \, d\mathbf{r}' - \frac{1}{2} \int \frac{\phi_a(\mathbf{r}')\phi_a(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|} \, d\mathbf{r}'
$$

18.104.2 Member Function Documentation

18.104.2.1 compute_benchmark()

```
double RepulsionEnergySolver::compute_benchmark (
        const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` benchmark method

Parameters

method	- benchmark method

Implements oepdev::OEPDevSolver.

18.104.2.2 compute_oep_based()

```
double RepulsionEnergySolver::compute_oep_based (
         const std::string & method = "DEFAULT" ) [virtual]
```

Each solver object has one `DEFAULT` OEP-based method.

Parameters

method	- flavour of OEP model

Implements oepdev::OEPDevSolver.

The documentation for this class was generated from the following files:

- oepdev/libsolver/solver.h
- oepdev/libsolver/solver_energy_pauli.cc

18.105 oepdev::RHFPerturbed Class Reference

RHF theory under electrostatic perturbation.

```
#include <scf_perturb.h>
```

Inheritance diagram for oepdev::RHFPerturbed:
Public Member Functions

- RHFPerturbed (std::shared_ptr< psi::Wavefunction > ref_wfn, std::shared_ptr< psi::SuperFunctional > functional)

    Build from wavefunction and superfunctional.

- RHFPerturbed (std::shared_ptr< psi::Wavefunction > ref_wfn, std::shared_ptr< psi::SuperFunctional > functional, psi::Options &options, std::shared_ptr< psi::PSIO > psio)

Build from wavefunction and superfunctional + options and psio.

- virtual ∼RHFPerturbed ()

  Clear memory.

- virtual double compute_energy ()

  Compute total energy.

- virtual void set_perturbation (std::shared_ptr< psi::Vector > field)

  Perturb the system with external electric field.

- virtual void set_perturbation (const double &fx, const double &fy, const double &fz)

  This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

- virtual void set_perturbation (std::shared_ptr< psi::Vector > position, const double &charge)

  Perturb the system with a point charge.

- virtual void set_perturbation (const double &rx, const double &ry, const double &rz, const double &charge)

  This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

- std::shared_ptr< psi::Matrix > Vpert () const

  Get a copy of the perturbation potential one-electron matrix.

- double nuclear_interaction_energy () const

  Get the interaction energy of the nuclei with the perturbing potential.

Protected Member Functions

- virtual void perturb_Hcore ()

  Add the electrostatic perturbation to the Hcore matrix.

Protected Attributes

- std::shared_ptr< psi::Vector > perturbField_

  Perturbing electric field.

- std::shared_ptr< PerturbCharges > perturbCharges_

  Perturbing charges.

- std::shared_ptr< psi::Matrix > Vpert_

  Perturbation potential one-electron matrix.

- double nuclearInteractionEnergy_

  Electrostatic interaction energy due to nuclei.

18.105.1 Detailed Description

Compute RHF wavefunction under the following conditions:

- external uniform electric field

- set of point charges The mixed conditions can also be used.

Theory

The electrostatic perturbation is here understood as a distribution of external (generally non-uniform) electric field. It is assumed that this perturbation is one-electron in nature. Therefore, the one-electron Hamiltonian is changed according to the following

$$\mathbf{H}^{\text{core}} \rightarrow \mathbf{H}^{\text{core}} + \sum_n q_n \mathbf{V}^{(n)} - \mathbb{M} \cdot \mathbf{F}$$

where q_n is the external classical point charge, $\mathbf{V}^{(n)}$ is the associated matrix of potential integrals, $\mathbb{M}$ is the vector of dipole integrals and $\mathbf{F}$ is an external uniform electric field. The total energy is then computed by performing an SCF procedure on the above one-electron Hamiltionian. The contribution due to nuclei is included, i.e.,

$$E_{\text{Nuc}} \rightarrow E_{\text{Nuc}-\text{Nuc}} + \sum_{In} \frac{q_n Z_I}{r_{In}} - \mu_{\text{Nuc}} \cdot \mathbf{F}$$

where μ_{Nuc} is the nuclear dipole moment and Z_I is the atomic number of the Ith nucleus. It is added in the nuclear repulsion energy $E_{\text{Nuc}-\text{Nuc}}$ (note that the resulting energy can be negative as well depending on the electric field direction and configuration of point charges.

The documentation for this class was generated from the following files:

18.106.1   Detailed Description

```
---------------------------------------------------------------------------
Reduced Variational Scheme (RVS)
Ref.: Stevens & Fink, Chem. Phys. Lett., Vol. 139, pp. 15-22 (1987)

Implementation for closed-shell systems.
---------------------------------------------------------------------------

Notes:

o This code contains general implementation of the RVS-SCF method.
Currently, only dimers are automatically analyzed. To use for
multimers, define a subclass and redefine the `run` method
to include n-mers for n>2.

o Projection of frozen orbitals is achieved by transforming
Fock matrix to orthogonal MO basis of entire n-fragment
aggregate, and setting all the off-diagonal matrix elements
that are associated to the frozen orbitals to zero
[Kairys & Jensen, J. Phys. Chem. A, Vol. 104, No. 28, 2000].

o Orthogonal MO basis is constructed from the original
mutually non-orthogonal MOs of isolated fragments by
GrammSchmidt orthogonalization with respect to the frozen
MOs. If no frozen MOs are requested, symmetric Lowdin
orthogonalization is performed instead.

---------------------------------------------------------------------------
Usage for dimers:

e, wfn = psi4.energy('scf', return_wfn=True)
rvs = RVS(wfn)
rvs.run_dimer(conver=1.0e-7, maxiter=100, ndamp=10)
print(rvs)
# access variables:
print(rvs.vars.keys())

---------------------------------------------------------------------------
Example for redefining for multimers:

class Trimer_RVS(RVS):
 def __init__(self, wfn):
     super(RVS, self).__init__(wfn)

 def run_trimer(self, conver, maxiter, ndamp):
     "Here there is your implementation for trimer"

     # example for A-B-C (0-1-2) trimer:

     # energy of Hartree product
     #                          frozen_occ active_vir exclude_occ
     E_Ao_Bo_Co      = self._scf([ ], [    ], [ ], conver, maxiter, damp=0.0, ndamp=nd

     # energy of Bocc frozen, virtual space composed of Cvir and Bvir, and A molecule e
     E_fBo_Bv_Cv     = self._scf([1], [1,2], [0], conver, maxiter, damp=0.0, ndamp=nd

     # energy of Bocc and Cocc frozen and all virtual space included, Aocc active
```

```
        E_fBo_fCo_Av_Bv_Cv= self._scf([1,2], [0,1,2], [ ], conver, maxiter, damp=0.0, ndam

  def __repr__(self):
      "Print the contents"
      log = ''
      # ...
      return str(log)

 ---------------------------------------------------------------------------

18.107.1   Detailed Description

```
 ---------------------------------------------------------------------------
                    Self-Consistent Field (SCF) Procedure for Hartree-Fock Model
 ---------------------------------------------------------------------------

 Demo for RHF-SCF method (closed shells). Implements SCF algorithm
 with primitive damping of the AO Fock matrix.
```

```
 Usage:
scf = SCF(molecule)
scf.run(maxit=30, conv=1.0e-7, guess=None, damp=0.01, ndamp=10, verbose=True)

 The above example runs SCF on 'molecule' psi4.core.Molecule object
 starting from core Hamiltonian as guess (guess=None)
 and convergence 1.0E-7 A.U. in total energy with 30 maximum iterations
 (10 of which are performed by damping of the Fock matrix with damping coefficient of 0.
 The SCF iterations are printed to standard output (verbose=True).
 --------------------------------------------------------------------------------
                                                            Last Revision: Gund

Date

    2018/03/01 17:22:00

18.108.2 Constructor & Destructor Documentation

18.108.2.1 ShellCombinationsIterator()

```
ShellCombinationsIterator::ShellCombinationsIterator (
            int nshell )
```

Parameters

nshell	- number of shells this iterator is for

18.108.3 Member Function Documentation

18.108.3.1 ao_iterator()

```
std::shared_ptr< AOIntegralsIterator > ShellCombinationsIterator::ao_iterator
(
```

```
std::string mode = "ALL" ) const  [virtual]
```

Make an AO integral iterator based on current shell

Parameters

mode	- either "ALL" or "UNIQUE" (iterate over all or unique integrals)

Returns

iterator over AO integrals

18.108.3.2 build() [1/2]

```
std::shared_ptr< ShellCombinationsIterator > ShellCombinationsIterator::build
(
          const IntegralFactory & ints,
          std::string mode = "ALL",
          int nshell = 4 )  [static]
```

Parameters

ints	- integral factory
mode	- mode of iteration (either `ALL` or `UNIQUE`)
nshell	- number of shells to iterate through

Returns

shell iterator

Examples:

example_integrals_iter.cc.

18.108.3.3 build() [2/2]

```
std::shared_ptr< ShellCombinationsIterator > ShellCombinationsIterator::build
(
          const psi::IntegralFactory & ints,
          std::string mode = "ALL",
          int nshell = 4 )  [static]
```

Parameters

ints	- integral factory
mode	- mode of iteration (either `ALL` or `UNIQUE`)
nshell	- number of shells to iterate through

Returns

shell iterator

18.108.3.4 compute_shell() [1/2]

```
void ShellCombinationsIterator::compute_shell (
        std::shared_ptr< oepdev::TwoBodyAOInt > tei ) const [pure virtual]
```

Compute integrals in a current shell. Works both for oepdev::TwoBodyAOInt and psi::TwoBodyAOInt

Parameters

tei	- two body integral object

Implemented in oepdev::AllAOShellCombinationsIterator_2, and oepdev::AllAOShellCombinationsIterator_4.

18.108.3.5 compute_shell() [2/2]

```
void ShellCombinationsIterator::compute_shell (
        std::shared_ptr< psi ::TwoBodyAOInt > tei ) const [pure virtual]
```

Compute integrals in a current shell. Works both for oepdev::TwoBodyAOInt and psi::TwoBodyAOInt

Parameters

tei	- two body integral object

Implemented in oepdev::AllAOShellCombinationsIterator_4.

- std::shared_ptr< psi::Matrix > compute (void)

    Perform the generalized density fit.

Additional Inherited Members

18.110.1 Detailed Description

The density fitting map projects the OEP onto the auxiliary, nearly complete basis set space through application of the resolution of identity. Refer to density fitting in complete space for more details.

18.110.2 Determination of the OEP matrix

Coefficients $\mathbf{G}$ are computed by using the following relation

$$\mathbf{G}^{(i)} = \mathbf{v}^{(i)} \cdot \mathbf{S}^{-1}$$

where

$$S_{\xi\eta} = (\xi|\eta)$$
$$v_{\xi}^{(i)} = (\xi|\hat{v}i)$$

In the above, $|$ denotes the single integration over electron coordinate, i.e.,

$$(a|b) \equiv \int d\mathbf{r}\phi_a^*(\mathbf{r})\phi_b(\mathbf{r})$$

whereas the spatial form of the potential operator $\hat{v}$ can be expressed by

$$v(\mathbf{r}) \equiv \int d\mathbf{r}' \frac{\rho(\mathbf{r}')}{|\mathbf{r}' - \mathbf{r}|}$$

with $\rho(\mathbf{r})$ being the effective one-electron density associated with $\hat{v}$.

18.114.3.1 set()

```
def gefp.math.matrix.Superimposer.set (
            self,
            reference_coords,
            coords )
```

```
Set the coordinates to be superimposed.
coords will be put on top of reference_coords.

o reference_coords: an NxDIM array
o coords: an NxDIM array

DIM is the dimension of the points, N is the number
of points to be superimposed.
```

18.116 oepdev::test::Test Class Reference

Manages test routines.

```
#include <test.h>
```

Public Member Functions

- Test (std::shared_ptr< psi::Wavefunction > wfn, psi::Options &options)

    Construct the tester.

- ∼Test ()

    Destructor.

- double run (void)

    Pefrorm the test.

Protected Member Functions

- double test_basic (void)

    Test the basic functionalities of OEPDev.

- double test_basis_rotation (void)

    Test the AO basis set rotation from oepdev::ao_rotation_matrix.

- double test_cis_rhf (void)

    Test the CIS(RHF) method.

- double test_cis_uhf (void)

    Test the CIS(UHF) method.

- double test_cis_rhf_dl (void)

    Test the CIS(RHF) method with Davidson-Liu algorithm.

- double test_cis_uhf_dl (void)

    Test the CIS(UHF) method with Davidson-Liu algorithm.

- double test_cphf (void)

    Test the CPHF method.

- double test_dmatPol (void)

    Test the density matrix susceptibility (X = 1)

- double test_dmatPolX (void)

    Test the density matrix susceptibility.

- double test_eri_1_1 (void)

    Test the *oepdev::ERI_1_1* class against psi::ERI.

- double test_eri_2_2 (void)

    Test the *oepdev::ERI_2_2* class against psi::ERI.

- double test_eri_3_1 (void)

    Test the *oepdev::ERI_3_1* class against psi::ERI.

- double test_unitaryOptimizer (void)

    Test the *oepdev::UnitaryOptimizer* class.

- double test_unitaryOptimizer_2 (void)

    Test the *oepdev::UnitaryOptimizer_2* class.

- double test_unitaryOptimizer_4_2 (void)

    Test the *oepdev::UnitaryOptimizer_4_2* class.

- double test_scf_perturb (void)

    Test the *oepdev::RHFPerturbed* class.

- double test_quambo (void)

    Test the *oepdev::QUAMBO* class.

- double test_camm (void)

    Test the *oepdev::CAMM* class.

- double test_dmtp_pot_field (void)

    Test the *oepdev::MultipoleConvergence* class: potential and field calculations.

- double test_dmtp_energy (void)

    Test the oepdev::DMTP class for energy calculations.

- double test_efp2_energy (void)

    Test the oepdev::EFP2_GenEffPar and oepdev::EFP2_Computer classes.

- double test_oep_efp2_energy (void)

    Test the oepdev::EFP2_GenEffPar and oepdev::EFP2_Computer classes.

- double test_kabsch_superimposition (void)

    Test the *oepdev::KabschSuperimposer*.

- double test_dmtp_superimposition (void)

    Test the oepdev::DMTP class for superimposition.

- double test_esp_solver (void)

    Test the *oepdev::ESPSolver*.

- double test_points_collection3d (void)

    Test the cube file generation (*oepdev::Field3D* electrostatic potential and *oepdev::Points3DIterator* for cube collection)

- double test_ct_energy_benchmark_ol (void)

    Test the Charge-transfer Energy Solver (benchmark method Otto-Ladik)

- double test_ct_energy_oep_based_ol (void)

Test the Charge-transfer Energy Solver (oep-based method Otto-Ladik)

- double test_rep_energy_benchmark_hs (void)

  Test the Repulsion Energy Solver: (benchmark method Hayes-Stone)

- double test_rep_energy_benchmark_dds (void)

  Test the Repulsion Energy Solver: (benchmark method Density-Based - DDS/HF)

- double test_rep_energy_benchmark_murrell_etal (void)

  Test the Repulsion Energy Solver: (benchmark method Murrell-etal)

- double test_rep_energy_oep_based_murrell_etal (void)

  Test the Repulsion Energy Solver: (OEP-based method Murrell-etal)

- double test_rep_energy_benchmark_ol (void)

  Test the Repulsion Energy Solver: (benchmark method Otto-Ladik)

- double test_rep_energy_benchmark_efp2 (void)

  Test the Repulsion Energy Solver: (benchmark method EFP2)

- double test_custom (void)

  Test the custom code (to be deprecated)

Protected Attributes

- std::shared_ptr< psi::Wavefunction > wfn_

  Wavefunction object.

- psi::Options & options_

  Psi4 Options.

Public Attributes

- oepdev::MultipoleConvergence::ConvergenceLevel trcamm_convergence

  Convergence object for Coulombic coupling under TrCAMM approximation.

- bool diagonal_correction

  Environmental correction activated?

- bool mulliken_approximation

  Mulliken approximation activated?

- bool overlap_correction

  Overlap correction acrivatved?

- bool trcamm_approximation

  TrCAMM approximation activated?

- std::map< std::string, double > v0
- oepdev::SharedDMTPConvergence v0_trcamm

  V0_Coul multipole convergence.

- double s12

  Overlap matrix element between basis functions.

- double s13

  Overlap matrix element between basis functions.

- double s14

  Overlap matrix element between basis functions.

- double s23

  Overlap matrix element between basis functions.

- double s24

  Overlap matrix element between basis functions.

- double s34

Overlap matrix element between basis functions.

- double e1

  Diagonal Hamiltonian matrix element.
- double e2

  Diagonal Hamiltonian matrix element.
- double e3

  Diagonal Hamiltonian matrix element.
- double e4

  Diagonal Hamiltonian matrix element.

- double de1

  Environmental correction to the E_n for n =1,2.
- double de2

  Environmental correction to the E_n for n =1,2.

Protected Attributes

- double c_

  Conversion factor (unused now)

18.117.1 Detailed Description

Container for storing and managing TI data for EET coupling calculations, according to Fujimoto JCP 2012:

- exciton Hamiltonian matrix elements

- overlap integrals between basis states

- TrCAMM EET coupling convergence object

Contains useful methods to process exciton Hamiltonian matrix elements:

- compute direct and indirect EET coupling constants

- compute overlap-corrected exciton Hamiltonian off-diagonal matrix elements

- include or exclude environmental correction in the diagonal exciton Hamiltonian

- activate TrCAMM approximation of $V^{\mathrm{Coul},(0)}$

- activate Mulliken approximation for $V^{\text{Exch},(0)}$ and $V^{\text{CT},(0)}$

To activate/deactivate the various approximations and corrections listed above, set the following attributes

- `diagonal_correction`

- `mulliken_approximation`

- `overlap_correction`

- `trcamm_approximation`

to `true`/`false`, accroding to your need.

Example of usage.

```c++
{c++}
  // Set up exciton Hamiltonian
  TIData data = TIData();
  data.set_s(S12, S13, S14, S32, S42, S34);
  data.set_e(E1, E2, E3, E4);
  data.set_de(E1 - E01, E2 - E02);
  data.v0["COUL"]= V0_Coul;
  data.v0["EXCH"]= V0_Exch;
  data.v0["ET1"] = V0_ET1;
  data.v0["ET2"] = V0_ET2;
  data.v0["HT1"] = V0_HT1;
  data.v0["HT2"] = V0_HT2;
  data.v0["CT" ] = V0_CT;
  data.v0["EXCH_M"]= V0_Exch_M;
  data.v0["CT_M"] = V0_CT_M;

  // Set up appriximations and corrections
  data.diagonal_correction = true;
  data.mulliken_approximation= false;
  data.trcamm_approximation = false;
  data.overlap_correction = true;

  // Compute overlap-corrected indirect coupling matrix elements
  double V_ET1 = data.overlap_corrected("ET1");
  double V_ET2 = data.overlap_corrected("ET2");
  double V_HT1 = data.overlap_corrected("HT1");
  double V_HT2 = data.overlap_corrected("HT2");
  double V_CT  = data.overlap_corrected("CT") ;
  double V_CT_M= data.overlap_corrected("CT_M");

  // Compute final coupling contributions
  double V_Coul = data.overlap_corrected("COUL");
  double V_Exch = data.overlap_corrected("EXCH");
  double V_Ovrl = data.overlap_corrected("OVRL");

  double V_Exch_M= data.overlap_corrected("EXCH_M");

  double V_TI_2 = data.coupling_indirect_ti2();
  double V_TI_3 = data.coupling_indirect_ti3();

  data.diagonal_correction = false;
  double V0_TI_2 = data.coupling_indirect_ti2();
  double V0_TI_3 = data.coupling_indirect_ti3();

  data.mulliken_approximation = true;
  double V0_TI_3_M = data.coupling_indirect_ti3();
  data.diagonal_correction = true;
  double V_TI_3_M = data.coupling_indirect_ti3();
```

```
double V_direct = V_Coul + V_Exch + V_Ovrl;
double V_indirect = V_TI_2 + V_TI_3;
```

oepdev::EETCouplingSolver

18.117.2 Member Function Documentation

18.117.2.1 coupling_direct()

```
double TIData::coupling_direct (
          void ) [virtual]
```

Compute the direct EET coupling constant.

Returns

$$V^{\mathrm{Dir}} = V^{\mathrm{Coul}} + V^{\mathrm{Exch}} + V^{\mathrm{Ovrl}}$$

Overlap and diagonal corrections as well as TrCAMM and Mulliken approximations for Coulomb and pure exchange parts can be set.

18.117.2.2 coupling_direct_coul()

```
double TIData::coupling_direct_coul (
          void ) [virtual]
```

Compute the direct EET coupling constant in Forster limit (Coulombic approximation)

Returns

$$V^{\mathrm{Dir}} = V^{\mathrm{Coul}}$$

Overlap correction as well as TrCAMM approximation for Coulomb coupling can be set.

18.117.2.3 coupling_direct_exch()

```
double TIData::coupling_direct_exch (
          void ) [virtual]
```

Compute the direct EET coupling constant due to pure exchange.

Returns

$$V^{\mathrm{Dir}} = V^{\mathrm{Exch}}$$

Overlap correction as well Mulliken approximation for pure exchange coupling can be set.

18.117.2.4 coupling_indirect()

```
double TIData::coupling_indirect (
            void  ) [virtual]
```

Compute the indirect EET coupling constant.

Returns

$$V^{\text{Indir}} = V^{\text{TI},(2)} + V^{\text{TI},(3)}$$

Overlap and diagonal corrections as well as Mulliken approximations for $V^{\text{CT},(0)}$ can be set.

18.117.2.5 coupling_indirect_ti2()

```
double TIData::coupling_indirect_ti2 (
            void  ) [virtual]
```

Compute the indirect EET coupling constant in second-order with respect to TI.

Returns

$$V^{\text{TI},(2)} = -\frac{V^{\text{ET1}}V^{\text{HT2}}}{E_3 - E_1} - \frac{V^{\text{ET2}}V^{\text{HT1}}}{E_4 - E_1}$$

Overlap and diagonal corrections can be set.

18.117.2.6 coupling_indirect_ti3()

```
double TIData::coupling_indirect_ti3 (
            void  ) [virtual]
```

Compute the indirect EET coupling constant in third-order with respect to TI.

Returns

$$V^{\text{TI},(3)} = \frac{V^{\text{CT}}\left(V^{\text{ET1}}V^{\text{ET2}} + V^{\text{HT1}}V^{\text{HT2}}\right)}{(E_3 - E_1)(E_4 - E_1)}$$

Overlap and diagonal corrections as well as Mulliken approximations for $V^{\text{CT},(0)}$ can be set.

18.117.2.7 coupling_total()

```
double TIData::coupling_total (
            void  ) [virtual]
```

Compute the *total* EET coupling constant.

Returns

$$V^{\text{Total}} = V^{\text{Dir}} + V^{\text{Indir}}$$

Overlap and diagonal corrections, TrCAMM approximation for Coulomb coupling, and Mulliken approximations for pure exchange coupling and $V^{\text{CT},(0)}$ can be set.

18.117.2.8 coupling_trcamm()

```
double TIData::coupling_trcamm (
          const std::string & rn ) [virtual]
```

Compute Coulombic coupling approximated by TrCAMM.

Parameters

rn	- convergence of TrCAMM coupling. Can be from `R1` to `R5`, which corresponds to the R^{-n} series expansion of distributed multipoles.

Returns

$$V^{\text{Coul},(0)} \approx V^{\text{TrCAMM},(0)}(R^{-n})$$

18.117.2.9 overlap_corrected()

```
double TIData::overlap_corrected (
          const std::string & type ) [virtual]
```

Compute overlap corrected matrix elements.

Parameters

type	- matrix element $V^{\text{type},(0)}$ subject to overlap correction, where type is one of the following:

- `COUL` - $V^{\text{Coul},(0)}$,

- `EXCH` - $V^{\text{Exch},(0)}$,

- `TrCAMM_R1` - $V^{\text{TrCAMM},(0)}(R^{-1})$,

- `TrCAMM_R2` - $V^{\text{TrCAMM},(0)}(R^{-2})$,

- `TrCAMM_R3` - $V^{\text{TrCAMM},(0)}(R^{-3})$,

- `TrCAMM_R4` - $V^{\text{TrCAMM},(0)}(R^{-4})$,

- `TrCAMM_R5` - $V^{\text{TrCAMM},(0)}(R^{-5})$,

- `ET1` - $V^{\text{ET1},(0)}$,

- `ET2` - $V^{\text{ET2},(0)}$,

- `HT1` - $V^{\text{HT1},(0)}$,

- `HT2` - $V^{\text{HT2},(0)}$,

- `CT` - $V^{\text{CT},(0)}$,

- `CT_M` - Mulliken-approximated $V^{\text{CT},(0)}$,

- `EXCH_M` - Mulliken-approximated $V^{\text{Exch},(0)}$.

If type = `OVRL`, the overlap-correction to the direct EET coupling constant is returned, V^{Ovrl}.

Returns

overlap-corrected exciton Hamiltonian matrix element contribution of selected type

Diagonal correction can be set.

18.117.2.10 overlap_corrected_direct() [1/2]

```
double TIData::overlap_corrected_direct (
        void  ) [virtual]
```

Compute overlap-corrected direct EET coupling constant.

Returns

$$V^{\text{Dir}} = V^{\text{Coul}} + V^{\text{Exch}} + V^{\text{Ovrl}}$$

Diagonal correction, TrCAMM approximation and Mulliken approximation can be set.

18.117.2.11 overlap_corrected_direct() `[2/2]`

```
double TIData::overlap_corrected_direct (
        double v ) [virtual]
```

Compute overlap-corrected direct EET coupling constant from value *v*.

Returns

$$\frac{v}{1-S_{12}^2}$$

18.117.2.12 overlap_corrected_indirect()

```
double TIData::overlap_corrected_indirect (
        double v,
        double s ) [virtual]
```

Compute overlap-corrected coupling constant from value *v* and associated overlap integral *s*.

Returns

$$\frac{1}{1-s^2}\left(v - \frac{(E_1+E_2)s}{2}\right)$$

Diagonal correction can be set.

18.117.3 Member Data Documentation

18.117.3.1 v0

```
std::map<std::string, double> oepdev::TIData::v0
```

Dictionary of all zeroth-order off-diagonal matrix elements.

Use only the following keywords:

- `COUL` - $V^{\text{Coul},(0)}$,

- `EXCH` - $V^{\text{Exch},(0)}$,

- `TrCAMM_R1` - $V^{\text{TrCAMM},(0)}(R^{-1})$,

- `TrCAMM_R2` - $V^{\text{TrCAMM},(0)}(R^{-2})$,

- `TrCAMM_R3` - $V^{\text{TrCAMM},(0)}(R^{-3})$,

- `TrCAMM_R4` - $V^{\text{TrCAMM},(0)}(R^{-4})$,

- $\texttt{TrCAMM\_R5}$ - $V^{\text{TrCAMM},(0)}(R^{-5})$,

- $\texttt{ET1}$ - $V^{\text{ET1},(0)}$,

- $\texttt{ET2}$ - $V^{\text{ET2},(0)}$,

- $\texttt{HT1}$ - $V^{\text{HT1},(0)}$,

- $\texttt{HT2}$ - $V^{\text{HT2},(0)}$,

- $\texttt{CT}$ - $V^{\text{CT},(0)}$,

- $\texttt{CT\_M}$ - Mulliken-approximated $V^{\text{CT},(0)}$,

- $\texttt{EXCH\_M}$ - Mulliken-approximated $V^{\text{Exch},(0)}$,

- $\texttt{OVRL}$ - V^{Ovrl}.

Protected Member Functions

- **TwoBodyAOInt** (const IntegralFactory ∗intsfactory, int deriv=0)
- **TwoBodyAOInt** (const TwoBodyAOInt &rhs)

18.118.1 Member Function Documentation

18.118.1.1 compute() [1/2]

```
void oepdev::TwoBodyAOInt::compute (
        std::shared_ptr< psi::Matrix > & result,
        int ibs1 = 0,
        int ibs2 = 2 ) [virtual]
```

Parameters

result	- matrix where to store (i‖j) two-body integrals
ibs1	- first basis set axis
ibs2	- second basis set axis

18.118.1.2 compute() [2/2]

```
void oepdev::TwoBodyAOInt::compute (
        psi::Matrix & result,
        int ibs1 = 0,
        int ibs2 = 2 ) [virtual]
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

Protected Member Functions

- int get_cart_am (int am, int n, int x)

    Get the angular momentum per Cartesian component.

- double get_R (int N, int L, int M)

    Get the (N,L,M)th McMurchie-Davidson coefficient.

- virtual size_t compute_doublet (int, int)

    Computes the ERI's between three shells.

- virtual size_t compute_triplet (int, int, int)

    Computes the ERI's between three shells.

- virtual size_t compute_quartet (int, int, int, int)

    Computes the ERI's between four shells.

Protected Attributes

- const int max_am_

    Maximum angular momentum.

- const int n_max_am_

    Maximum number of angular momentum functions.

- psi::Fjt ∗ fjt_

    Computes the fundamental: Boys function value at T for degree v.

- bool use_shell_pairs_

    Should we use shell pair information?

- const double cartMap_ [60]

    Map of Cartesian components per each am.

- const double df_ [8]

    Double factorial array.

- double ∗ mdh_buffer_R_

    Buffer for the McMurchie-Davidson-Hermite R coefficents.

18.119.1 Detailed Description

Implements the McMurchie-Davidson recursive scheme for all integral types. The integral can be defined for any number of Gaussian centres, thus it is not limited to 2-by-2 four-centre ERI. Currently implemented subtypes are:

- oepdev::ERI_1_1 - 2-centre electron-repulsion integral (i|j)

- oepdev::ERI_2_2 - 4-centre electron-repulsion integral (ij|kl)

- oepdev::ERI_3_1 - 4-centre electron-repulsion integral (ijk|l)

18.121.1 Detailed Description

Associated options:

- CIS_TYPE - must be set to DAVIDSON_LIU (Default).

- CIS_SCHWARTZ_CUTOFF - Cutoff for Schwartz ERI screening. Default: 0.0.

Implementation

Diagonal Hamiltonian elements

They are computed by using direct method with Schwartz screening of AO ERI's. The implementation formula is

$$H_{ii}^{aa} = \varepsilon_a - \varepsilon_i + \sum_{\alpha\beta\gamma\delta} (\alpha\beta|\gamma\delta) C_{\alpha i} C_{\delta a} \left(C_{\beta a} C_{\gamma i} - C_{\beta i} C_{\gamma a} \right)$$

$$H_{\bar{i}\bar{i}}^{\overline{aa}} = \varepsilon_{\bar{a}} - \varepsilon_{\bar{i}} + \sum_{\alpha\beta\gamma\delta} (\alpha\beta|\gamma\delta) C_{\alpha\bar{i}} C_{\delta\bar{a}} \left(C_{\beta\bar{a}} C_{\gamma\bar{i}} - C_{\beta\bar{i}} C_{\gamma\bar{a}} \right)$$

Sigma vectors

The sigma vectors are computed from

$$\sigma_i^{a,k} = (\varepsilon_a - \varepsilon_i) b_i^{a,k} + J_i^a(\mathbf{T}^{(k)}) + J_i^a(\overline{\mathbf{T}^{(k)}}) - K_i^a(\mathbf{T}^{(k)})$$

$$\sigma_{\bar{i}}^{\bar{a},k} = (\varepsilon_{\bar{a}} - \varepsilon_{\bar{i}}) b_{\bar{i}}^{\bar{a},k} + J_{\bar{i}}^{\bar{i}}(\mathbf{T}^{(k)}) + J_{\bar{i}}^{\bar{i}}(\overline{\mathbf{T}^{(k)}}) - K_{\bar{i}}^{\bar{i}}(\overline{\mathbf{T}^{(k)}})$$

where *k* labels the vectors and where the generalized one-particle density matrices are defined by

$$T_{\gamma\delta}^{(k)} = \sum_{jb} C_{\delta b} b_j^{b,k} C_{\gamma j}$$

$$\overline{T}_{\gamma\delta}^{(k)} = \sum_{\bar{j}\bar{b}} C_{\delta\bar{b}} b_{\bar{j}}^{\bar{b},k} C_{\gamma\bar{j}}$$

The **J** and **K** matrices in AO basis are computed by using the `psi::JK` object, and subsequently transformed to CMO's.

18.124.1 Detailed Description

```
----------------------------------------------------------------------

Finds the unitary matrix X that optimizes the following function:

Z(X) = \sum_{ijkl} X_{ij}X_{kl} R_{jl} - \sum_{ij} X_{ij}P_{j}

where
* X is a square unitary matrix of size N x N
* R is a square, in general non-symmetric matrix of size N x N
* P is a vector of length N

Usage:
optimizer = UnitaryOptimizer(R, P, conv=1.0e-8, maxiter=100, verbose=True)
optimizer.maximize() #or minimize()
X = optimizer.X
Z = optimizer.Z

----------------------------------------------------------------------
                                          Last Revision: 25.03.2018
```

18.125.1 Detailed Description

The objective function of the orthogonal matrix $\mathbf{X}$

$$Z(\mathbf{X}) \equiv \sum_{ijkl} X_{ij} X_{kl} R_{jl} - \sum_{ij} X_{ij} P_j$$

is optimized by using the Jacobi iteration algorithm. In the above equation, $\mathbf{R}$ is a square, general real matrix of size $N \times N$ whereas $\mathbf{P}$ is a real vector of length N.

Algorithm.

Optimization of $\mathbf{X}$ is factorized into a sequence of 2-dimensional rotations with one real parameter γ:

$$\mathbf{X}^{\text{New}} = \mathbf{U}(\gamma) \cdot \mathbf{X}^{\text{Old}}$$

where

$$\mathbf{U}(\gamma) \equiv \begin{pmatrix} \ddots & & & & \\ & \cos(\gamma) & \cdots & \sin(\gamma) & \\ & \vdots & \ddots & \vdots & \\ & -\sin(\gamma) & \cdots & \cos(\gamma) & \\ & & & & \ddots \end{pmatrix}$$

is the Jacobi transformation matrix constructed for the Ith and Jth element from the entire N-dimensional set. For the sake of algirithmic simplicity, every iteration after $\mathbf{U}(\gamma)$ has been formed, $\mathbf{X}^{\text{Old}}$ is for a while assumed to be an identity matrix and the $\mathbf{R}$ matrix and $\mathbf{P}$ vector are transformed according to the following formulae

$$\mathbf{R} \rightarrow \mathbf{U}\mathbf{R}\mathbf{U}^T$$
$$\mathbf{P} \rightarrow \mathbf{U}\mathbf{P}$$

The full transformation matrix is accumulated in the memory buffer until convergence.

In each iteration, the optimum angle γ is found as follows: First, the roots of the finite Fourier series

$$A \sin(\gamma) + B \cos(\gamma) + C \sin(2\gamma) + D \cos(2\gamma) = 0$$

are found. In the above equations, the expansion coefficients are given as

$$A = P_I + P_J - \sum_{k \neq I,J} (R_{Ik} + R_{Jk} + R_{kI} + R_{kJ})$$
$$B = P_I - P_J - \sum_{k \neq I,J} (R_{Ik} - R_{Jk} + R_{kI} - R_{kJ})$$
$$C = -2(R_{IJ} + R_{JI})$$
$$D = -2(R_{II} - R_{JJ})$$

and I, J are the chosen indices in the Jacobi iteration subspace. The roots are evaluated by applying the Boyd's method[1], in which they are given as

$$\gamma_n = \Re \left[-i \ln(\lambda_n) \right]$$

where λ_n is an eivenvalue of the following 4 by 4 complex matrix:

$$\begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{D+iC}{D-iC} & -\frac{B+iC}{D-iC} & 0 & -\frac{B-iC}{D-iC} \end{pmatrix}$$

Once the four roots of the Fourier series equation are found, one solution out of four is chosen which satisfies the global optimum condition, i.e., the largest increase/decrease in the objective function given by

$$\delta Z = A(1 - \cos(\gamma)) + B \sin(\gamma) + C \sin^2(\gamma) + \frac{D}{2} \sin(2\gamma)$$

The discrimination between the minimae/maximae is performed based on the evaluation of the Hessian of Z with respect to γ,

$$\frac{\partial^2 Z}{\partial \gamma^2} = A \cos(\gamma) - B \sin(\gamma) + 2C \cos(2\gamma) - 2D \sin(2\gamma)$$

All the $N(N-1)/2$ unique pairs of molecular orbitals are checked and the optimal set of γ, I, J is chosen to construct $\mathbf{X}^{\text{New}}$.

18.126.1 Detailed Description

The objective function of the orthogonal matrix $\mathbf{X}$

$$Z(\mathbf{X}) \equiv \sum_{ijk} X_{ji} X_{ki} P_{ijk}$$

is optimized by using the Jacobi iteration algorithm. In the above equation, $\mathbf{P}$ is a general real third-rank tensor of size N^3. The solver is equivalent to UnitaryOptimizer_4_2 in mathematical sense, in which the sixth-rank tensor is zero, hence costly N^6 memory alocation is avoided.

Algorithm.

Optimization of $\mathbf{X}$ is factorized into a sequence of 2-dimensional rotations with one real parameter γ:

$$\mathbf{X}^{\text{New}} = \mathbf{X}^{\text{Old}} \cdot \mathbf{U}(\gamma)$$

where

$$\mathbf{U}(\gamma) \equiv \begin{pmatrix} \ddots & & & & \\ & \cos(\gamma) & \cdots & \sin(\gamma) & \\ & \vdots & \ddots & \vdots & \\ & -\sin(\gamma) & \cdots & \cos(\gamma) & \\ & & & & \ddots \end{pmatrix}$$

is the Jacobi transformation matrix constructed for the Ith and Jth element from the entire N-dimensional set. For the sake of algorithmic simplicity, every iteration after $\mathbf{U}(\gamma)$ has been formed, $\mathbf{X}^{\text{Old}}$ is for a while assumed to be an identity matrix and the $\mathbf{P}$ tensor are transformed according to the following formulae

$$P_{ijk} \rightarrow \sum_{j'k'} P_{ij'k'} X_{j'j} X_{k'k}$$

The full transformation matrix is accumulated in the memory buffer until convergence.

In each iteration, the optimum angle γ is found as follows: First, the roots of the finite Fourier series

$$a_0 + \sum_{p=1}^{2} \left\{ a_p \cos(px) + b_p \sin(px) \right\} = 0$$

are found. In the above equations, the expansion coefficients are calculated analytically as a function of I, J - the chosen indices in the Jacobi iteration subspace. The roots are evaluated by applying the Boyd's method[1], in which they are given as

$$\gamma_n = \Re\left[-i \ln(\lambda_n)\right]$$

where λ_n is an eivenvalue of the following 4 by 4 complex matrix:

$$\begin{pmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{a_2+ib_2}{a_2-ib_2} & -\frac{a_1+ib_1}{a_2-ib_2} & -\frac{2a_0}{a_2-ib_2} & -\frac{a_1-ib_1}{a_2-ib_2} \end{pmatrix}$$

Once the four roots of the Fourier series equation are found, one solution out of four is chosen which satisfies the global optimum condition, i.e., the largest increase/decrease in the objective function given by

$$\delta Z = Z\left(\mathbf{U}(\gamma)\right) - Z(\mathbf{1})$$

The Hessian is not computed. All the $N(N-1)/2$ unique pairs of molecular orbitals are checked and the optimal set of γ, I, J is chosen to construct $\mathbf{X}^{\text{New}}$.

18.127 oepdev::UnitaryOptimizer 2 1 Class Reference

Public Member Functions

- UnitaryOptimizer_2_1 (psi::SharedMatrix P, psi::SharedVector p, double conv=1.0e-6, int maxiter=100, bool verbose=true)

  Create from P matrix and p vector and optimization options.

- ∼UnitaryOptimizer_2_1 ()

  Clear memory.

- bool maximize ()

  Run the minimization.

- bool minimize ()

  Run the maximization.

- psi::SharedMatrix X ()

  Get the unitary matrix (solution)

- double ∗∗ get_X () const

  Get the unitary matrix (pointer to solution)

- double Z ()

  Get the actual value of Z function.

- bool success () const

  Get the status of the optimization.

Protected Member Functions

- UnitaryOptimizer_2_1 (int n, double conv, int maxiter, bool verbose)

  Initialize the basic memory.

- void common_init_ ()

  Prepare the optimizer.

- void run_ (const std::string &opt)

  Run the optimization (intermediate interface)

- void optimize_ (const std::string &opt)

  Run the optimization (inner interface)

- void refresh_ ()

  Restore the initial state of the optimizer.

- void update_conv_ ()

  Update the convergence.

- void update_iter_ ()

  Update the iterates.

- void update_Z_ ()

  Update Z value.

- void update_P_ ()

  Uptade P tensor.

- void update_X_ ()

Update the solution matrix X.

- double eval_Z_ (psi::SharedMatrix X, psi::SharedMatrix P)

  Evaluate the objective Z function.

- double **eval_Z_** ()
- double eval_dZ_ (double g, psi::SharedMatrix, int I, int J)

  Evaluate the change in Z.

- double eval_Z_trial_ (int I, int J, double gamma)

  Evaluate the trial Z value.

- void form_X0_ ()

  Create identity matrix.

- void form_X_ (int I, int J, double gamma)

  Form unitary matrix X (store in buffer Xnew_)

- void form_next_X_ (const std::string &opt)

  Form the next unitary matrix X.

- Fourier5 get_fourier_ (int I, int J)

  Retrieve ABCD parameters for root search.

- void find_roots_boyd_ (const Fourier5 &abcd)

  Solve for all roots of equation A∗sin(g) + B∗cos(g) + C∗sin(2∗g) + D∗cos(2∗g) + E = 0 -> implements Boyd's method.

- double find_root_halley_ (double x0, const Fourier5 &abcd)

  Solve for root of equation A∗sin(g) + B∗cos(g) + C∗sin(2∗g) + D∗cos(2∗g) = 0 -> implements Halley's method.

- double find_gamma_ (const Fourier5 &abcd, int i, int j, const std::string &opt)

  Compute gamma from roots of base equations.

- bool lt_ (double a, double b)

  less-than function

- bool gt_ (double a, double b)

  greater-than function

- psi::SharedMatrix psi_X_ ()

  Form the Psi4 matrix with the transformation matrix.

Protected Attributes

- const int n_

  Dimension of the problem.

- const double conv_

  Convergence.

- const int maxiter_

  Maximum number of iterations.

- const bool verbose_

  Verbose mode.

- psi::SharedMatrix P_

  P tensor.

- psi::SharedMatrix P0_

  Reference P tensor.

- psi::SharedVector p_

  p vector

- psi::SharedMatrix X_

  X Matrix (accumulated solution)

- psi::SharedMatrix W_

  Work place 1.

- psi::SharedMatrix Y_

  Work place 2.

- psi::SharedMatrix Xold_

  Temporary X matrix.

- psi::SharedMatrix Xnew_

  Temporary X matrix.

- int niter_

  Current number of iterations.

- double S_ [4]

  Current solutions.

- double Zinit_

  Initial Z value.

- double Zold_

  Old Z value.

- double Znew_

  New Z value.

- double conv_current_

  Current convergence.

- bool success_

  Status of optimization.

18.127.1 Constructor & Destructor Documentation

18.127.1.1 UnitaryOptimizer_2_1() [1/2]

```
oepdev::UnitaryOptimizer_2_1::UnitaryOptimizer_2_1 (
          psi::SharedMatrix P,
          psi::SharedVector p,
          double conv = 1.0e-6,
          int maxiter = 100,
          bool verbose = true )
```

Parameters

P	- $\mathbf{P}$ matrix
p	- $\mathbf{p}$ vector
conv	- convergence in the Z function
maxiter	- maximum number of iterations
verbose	- whether print information of iteration process or not Sets up the optimizer.

18.127.1.2 UnitaryOptimizer_2_1() [2/2]

```
oepdev::UnitaryOptimizer_2_1::UnitaryOptimizer_2_1 (
        int n,
        double conv,
        int maxiter,
        bool verbose ) [protected]
```

Parameters

n	- dimensionality of the problem (N)
conv	- convergence in the Z function
maxiter	- maximum number of iterations
verbose	- whether print information of iteration process or not Sets up the optimizer.

18.128.1 Detailed Description

```
--------------------------------------------------------------------------

Finds the unitary matrix X that optimizes the following function:

Z(X) = \sum_{ijk} X_{ij}X_{ik} A_{jk} - \sum_{ij} X_{ij}B_{ji}

where
* X is a square unitary matrix of size N x N
* A is a square, in general non-symmetric matrix of size N x N
* B is a square, in general non-symmetric matrix of size N x N

Usage:
optimizer = UnitaryOptimizer_2_2(A, B, conv=1.0e-8, maxiter=100, verbose=True)
optimizer.maximize() #or minimize()
X = optimizer.X
Z = optimizer.Z

--------------------------------------------------------------------------
                                                 Last Revision: 25.03.2018
```

18.128.2 Constructor & Destructor Documentation

18.130.1 Detailed Description

The objective function of the orthogonal matrix $\mathbf{X}$

$$Z(\mathbf{X}) \equiv \sum_{ijklmn} X_{ki} X_{lj} X_{mi} X_{nj} R_{ijklmn} + \sum_{ijk} X_{ji} X_{ki} P_{ijk}$$

is optimized by using the Jacobi iteration algorithm. In the above equation, $\mathbf{R}$ is a general real sixth-rank tensor of size N^6 whereas $\mathbf{P}$ is a general real third-rank tensor of size N^3.

Algorithm.

Optimization of $\mathbf{X}$ is factorized into a sequence of 2-dimensional rotations with one real parameter γ:

$$\mathbf{X}^{\text{New}} = \mathbf{X}^{\text{Old}} \cdot \mathbf{U}(\gamma)$$

where

$$\mathbf{U}(\gamma) \equiv \begin{pmatrix} \ddots & & & & \\ & \cos(\gamma) & \cdots & \sin(\gamma) & \\ & \vdots & \ddots & \vdots & \\ & -\sin(\gamma) & \cdots & \cos(\gamma) & \\ & & & & \ddots \end{pmatrix}$$

is the Jacobi transformation matrix constructed for the Ith and Jth element from the entire N-dimensional set. For the sake of algirithmic simplicity, every iteration after $\mathbf{U}(\gamma)$ has been formed, $\mathbf{X}^{\text{Old}}$ is for a while assumed to be an identity matrix and the $\mathbf{R}$ as well as $\mathbf{P}$ tensors are transformed according to the following formulae

$$R_{ijklmn} \rightarrow \sum_{k'l'm'n'} R_{ijk'l'm'n'} X_{k'k} X_{l'l} X_{m'm} X_{n'n}$$

$$P_{ijk} \rightarrow \sum_{j'k'} P_{ij'k'} X_{j'j} X_{k'k}$$

The full transformation matrix is accumulated in the memory buffer until convergence.

In each iteration, the optimum angle γ is found as follows: First, the roots of the finite Fourier series

$$a_0 + \sum_{p=1}^{4} \left\{ a_p \cos(px) + b_p \sin(px) \right\} = 0$$

are found. In the above equations, the expansion coefficients are calculated analytically as a function of I, J - the chosen indices in the Jacobi iteration subspace. The roots are evaluated by applying the Boyd's method[1], in which they are given as

$$\gamma_n = \Re\left[-i\ln(\lambda_n)\right]$$

where λ_n is an eivenvalue of the following 8 by 8 complex matrix:

$$\begin{pmatrix} 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ -\frac{a_4+ib_4}{a_4-ib_4} & -\frac{a_3+ib_3}{a_4-ib_4} & -\frac{a_2+ib_2}{a_4-ib_4} & -\frac{a_1+ib_1}{a_4-ib_4} & -\frac{2a_0}{a_4-ib_4} & -\frac{a_1-ib_1}{a_4-ib_4} & -\frac{a_2-ib_2}{a_4-ib_4} & -\frac{a_3-ib_3}{a_4-ib_4} \end{pmatrix}$$

Once the eight roots of the Fourier series equation are found, one solution out of eight is chosen which satisfies the global optimum condition, i.e., the largest increase/decrease in the objective function given by

$$\delta Z = Z(\mathbf{U}(\gamma)) - Z(\mathbf{1})$$

The Hessian is not computed. All the $N(N-1)/2$ unique pairs of molecular orbitals are checked and the optimal set of γ, I, J is chosen to construct $\mathbf{X}^{\text{New}}$.

Additional Inherited Members

18.131.1 Detailed Description

Implements creation of the density matrix susceptibility tensors for which $\mathbf{X} \neq \mathbf{1}$. Guarantees the idempotency of the density matrix up to first-order in LCAO-MO variation.

Note

This method does not give better results than the X=1 method and is extremely time and memory consuming. Therefore, it is placed here only for future reference about solving unitary optimization problem in case it occurs.

- SharedMOSpace mospace (const std::string &label) const

  Get the MO space named `label` *(either* `OCC` *or* `VIR`*)*

- SharedMatrix Ca_subset (const std::string &basis="SO", const std::string &subset="ALL")
- SharedMatrix Cb_subset (const std::string &basis="SO", const std::string &subset="ALL")
- SharedMatrix C_subset_helper (SharedMatrix C, const Dimension &noccpi, SharedVector epsilon, const std::string &basis, const std::string &subset)

  Helpers for Ca_ and Cb_ matrix transformers.

- SharedVector epsilon_subset_helper (SharedVector epsilon, const Dimension &noccpi, const std::string &basis, const std::string &subset)

  Helper for epsilon transformer.

- void print_header (void)

  Print information about this wavefunction union.

- void print_mo_integrals (void)

  Print the MO ingegrals.

Protected Attributes

- int nIsolatedMolecules_

    Number of isolated molecules.

- SharedWavefunction dimer_wavefunction_

    The wavefunction for a dimer (electrons relaxed in the field of monomers)

- SharedIntegralTransform integrals_

    Integral transform object (2- and 4-index transformations)

- bool hasLocalizedOrbitals_

    whether orbitals of the union were localized (or not)

- std::map< const std::string, SharedMOSpace > mospacesUnion_

    Dictionary of MO spaces for the entire union (OCC and VIR)

- std::vector< SharedMolecule > l_molecule_

    List of molecules.

- std::vector< SharedBasisSet > l_primary_

    List of primary basis functions per molecule.

- std::vector< SharedBasisSet > l_auxiliary_

    List of auxiliary basis functions per molecule.

- std::vector< SharedBasisSet > l_intermediate_

    List of intermediate basis functions per molecule.

- std::vector< SharedBasisSet > l_guess_

    List of guess basis functions per molecule.

- std::vector< SharedWavefunction > l_wfn_

    List of original isolated wavefunctions (electrons unrelaxed)

- std::vector< std::string > l_name_

    List of names of isolated wavefunctions.

- std::vector< int > l_nbf_

    List of basis function numbers per molecule.

- std::vector< int > l_nmo_

    List of numbers of molecular orbitals (MO's) per molecule.

- std::vector< int > l_nso_

    List of numbers of SO's per molecule.

- std::vector< int > l_ndocc_

    List of numbers of doubly occupied orbitals per molecule.

- std::vector< int > l_nvir_

    List of numbers of virtual orbitals per molecule.

- std::vector< int > l_noffs_ao_

    List of basis set offsets per molecule.

- std::vector< double > l_energy_

    List of energies of isolated wavefunctions.

- std::vector< double > l_efzc_

List of frozen-core energies per isolated wavefunction.

- std::vector< bool > l_density_fitted_

  List of information per wfn whether it was obtained using DF or not.

- std::vector< int > l_nalpha_

  List of numbers of alpha electrons per isolated wavefunction.

- std::vector< int > l_nbeta_

  List of numbers of beta electrons per isolated wavefunction.

- std::vector< int > l_nfrzc_

  List of numbers of frozen-core orbitals per isolated molecule.

- std::vector< psi::SharedMatrix > l_ca_occ_

  List of occupied orbitals.

- std::vector< psi::SharedMatrix > l_ca_vir_

  List of virtual orbitals.

- std::vector< psi::SharedVector > l_eps_a_occ_

  List of occupied orbital energies.

- std::vector< psi::SharedVector > l_eps_a_vir_

  List of virtual orbital energies.

- std::vector< SharedLocalizer > l_localizer_

  List of orbital localizers.

- std::vector< std::map< const std::string, SharedMOSpace > > l_mospace_

  List of dictionaries of MO spaces.

- std::shared_ptr< psi::OEProp > oeprop_

  One-Electron Property.

18.132.1 Detailed Description

The WavefunctionUnion is the union of two unperturbed Wavefunctions.

Notes:

1. Works only for C1 symmetry! Therefore `this->nirrep() = 1`.

2. Does not set `reference_wavefunction_`

3. Sets `oeprop_` for the union of uncoupled molecules

1. Performs Hadamard sums on `H_`, `Fa_`, `Da_`, `Ca_` and `S_` based on uncoupled wavefunctions.

2. Since it is based on shallow copy of the original Wavefunction, it **changes** contents of this wavefunction. Reallocate and copy if you want to keep the original wavefunction.

Warnings:

1. Gradients, Hessians and frequencies are not touched, hence they are **wrong**!

2. Lagrangian (if present) is not touched, hence its **wrong**!

3. Ca/Cb and epsilon subsets were reimplemented from psi::Wavefunction to remove sorting of orbitals. However, the corresponding member functions are not virtual in psi::Wavefunction. This could bring problems when upcasting.

The following variables are *shallow* copies of variables inside the Wavefunction object, that is created for the *whole* molecule cluster:

- `basissets_` (DF/RI/F12/etc basis sets)_
- `basisset_` (ORBITAL basis set)
- `sobasisset_` (Primary basis set for SO integrals)
- `AO2SO_` (AO2SO conversion matrix (AO in rows, SO in cols)
- `molecule_` (Molecule that this wavefunction is run on)
- `options_` (Options object)
- `psio_` (PSI file access variables)
- `integral_` (Integral factory)
- `factory_` (Matrix factory for creating standard sized matrices)
- `memory_` (How much memory you have access to)
- `nalpha_`, `nbeta_` (Total alpha and beta electrons)
- `nfrzc_` (Total frozen core orbitals)
- `doccpi_` (Number of doubly occupied per irrep)
- `soccpi_` (Number of singly occupied per irrep)
- `frzcpi_` (Number of frozen core per irrep)
- `frzvpi_` (Number of frozen virtuals per irrep)
- `nalphapi_` (Number of alpha electrons per irrep)
- `nbetapi_` (Number of beta electrons per irrep)
- `nsopi_` (Number of so per irrep)
- `nmopi_` (Number of mo per irrep)
- `nso_` (Total number of SOs)
- `nmo_` (Total number of MOs)
- `nirrep_` (Number of irreps; must be equal to 1 due to symmetry reasons)
- `same_a_b_dens_` and `same_a_b_orbs_` The rest is altered so that the Wavefunction parameters reflect a cluster of non-interacting (uncoupled, isolated, unrelaxed) molecular electron densities.

18.132.2 Constructor & Destructor Documentation

18.132.2.1 WavefunctionUnion() [1/2]

```
oepdev::WavefunctionUnion::WavefunctionUnion (
          SharedWavefunction ref_wfn,
          Options & options )
```

Provide wavefunction with molecule containing at least 2 fragments.

Parameters

ref_wfn	- reference wavefunction
options	- Psi4 options

This constructor is used for C++ internal interface.

18.132.2.2 WavefunctionUnion() [2/2]

```
oepdev::WavefunctionUnion::WavefunctionUnion (
          SharedMolecule dimer,
          SharedBasisSet primary,
          SharedBasisSet auxiliary_df,
          SharedBasisSet guess,
          SharedBasisSet primary_1,
          SharedBasisSet primary_2,
          SharedBasisSet auxiliary_1,
          SharedBasisSet auxiliary_2,
          SharedBasisSet auxiliary_df_1,
          SharedBasisSet auxiliary_df_2,
          SharedBasisSet intermediate_1,
          SharedBasisSet intermediate_2,
          SharedBasisSet guess_1,
          SharedBasisSet guess_2,
          SharedWavefunction wfn_1,
          SharedWavefunction wfn_2,
          Options & options )
```

Provide molecule dimer and all the required monomer basis sets and wavefunctions.

Parameters

dimer	- molecule object
primary	- basis set object: dimer (primary)
auxiliary_df	- basis set object: dimer (DF SCF)
guess	- basis set object: dimer (guess)

Parameters

primary_1	- basis set object for 1st monomer
primary_2	- basis set object for 2nd monomer
auxiliary_1	- basis set object for 1st monomer
auxiliary_2	- basis set object for 2nd monomer
auxiliary_df_1	- basis set object for 1st monomer
auxiliary_df_2	- basis set object for 2nd monomer
intermediate_1	- basis set object for 1st monomer
intermediate_2	- basis set object for 2nd monomer
guess_1	- basis set object for 1st monomer
guess_2	- basis set object for 2nd monomer
wfn_1	- unperturbed wavefunction object
wfn_2	- unperturbed wavefunction object
options	- Psi4 options

This constructor is for interface with Python level.

18.132.3 Member Function Documentation

18.132.3.1 Ca_subset()

```
SharedMatrix oepdev::WavefunctionUnion::Ca_subset (
        const std::string & basis = "SO",
        const std::string & subset = "ALL" )
```

Return a subset of the Ca matrix in a desired basis

Parameters

basis	the symmetry basis to use AO, SO
subset	the subset of orbitals to return ALL, ACTIVE, FROZEN, OCC, VIR, FROZEN_OCC, ACTIVE_OCC, ACTIVE_VIR, FROZEN_VIR

Returns

the matrix in Pitzer order in the desired basis

18.132.3.2 Cb_subset()

```
SharedMatrix oepdev::WavefunctionUnion::Cb_subset (
```

```
const std::string & basis = "SO",
const std::string & subset = "ALL" )
```

Return a subset of the Cb matrix in a desired basis

Parameters

basis	the symmetry basis to use AO, SO
subset	the subset of orbitals to return ALL, ACTIVE, FROZEN, OCC, VIR, FROZEN_OCC, ACTIVE_OCC, ACTIVE_VIR, FROZEN_VIR

Returns

the matrix in Pitzer order in the desired basis

The documentation for this class was generated from the following files:

Classes

- class oepdev::GenEffPar

  Generalized Effective Fragment Parameters. Container Class.

- class oepdev::GenEffFrag

  Generalized Effective Fragment. Container Class.

- class oepdev::GenEffParFactory

  Generalized Effective Fragment Factory. Abstract Base.

- class oepdev::EFP2_GEFactory

  EFP2 GEFP Factory.

- class oepdev::OEP_EFP2_GEFactory

  OEP-EFP2 GEFP Factory.

- class oepdev::PolarGEFactory

  Polarization GEFP Factory. Abstract Base.

- class oepdev::AbInitioPolarGEFactory

  Polarization GEFP Factory from First Principles. Hartree-Fock Approximation.

- class oepdev::FFAbInitioPolarGEFactory

  Polarization GEFP Factory from First Principles: Finite-Difference Model. Arbitrary level of theory.

- class oepdev::GeneralizedPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- struct oepdev::GeneralizedPolarGEFactory::StatisticalSet

  A structure to handle statistical data.

- class oepdev::UniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::NonUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::LinearUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

- class oepdev::QuadraticUniformEFieldPolarGEFactory

  Polarization GEFP Factory with Least-Squares Parameterization.

Macros

- #define D1_INDEX(x, i, n) ((81∗(x))+(9∗(i))+(n))

    Get the index of McMurchie-Davidson-Hermite D1 coefficient stored in the `mdh_buffer_`*, that is attributed to the x Cartesian coordinate from angular momentum i of function 1, and the Hermite index n.*

- #define D2_INDEX(x, i, j, n) ((1377∗(x))+(153∗(i))+(17∗(j))+(n))

    Get the index of McMurchie-Davidson-Hermite D2 coefficient stored in the `mdh_buffer_`*, that is attributed to the x Cartesian coordinate from angular momenta i, j of function 1 and 2, and the Hermite index n.*

- #define D3_INDEX(x, i, j, k, n) ((18225∗(x))+(2025∗(i))+(225∗(j))+(25∗(k))+(n))

    Get the index of McMurchie-Davidson-Hermite D3 coefficient stored in the `mdh_buffer_`*, that is attributed to the x Cartesian coordinate from angular momenta i, j and k of function 1, 2 and 3, and the Hermite index n.*

- #define R_INDEX(n, l, m, j) ((14739∗(n))+(867∗(l))+(51∗(m))+(j))

    Get the index of McMurchie-Davidson R coefficient stored in the `mdh_buffer_R_` *from angular momenta n, l and m and the Boys index j.*

Functions

- double oepdev::d_N_n1_n2 (int N, int n1, int n2, double PA, double PB, double aP)

    Compute McMurchie-Davidson-Hermite (MDH) coefficient for binomial expansion.

- void oepdev::make_mdh_D1_coeff (int n1, double aPd, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for monomial expansion.

- void oepdev::make_mdh_D2_coeff (int n1, int n2, double aPd, double ∗PA, double ∗PB, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for binomial expansion.

- void oepdev::make_mdh_D3_coeff (int n1, int n2, int n3, double aPd, double ∗PA, double ∗PB, double ∗PC, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for trinomial expansion.

- void oepdev::make_mdh_D2_coeff_explicit_recursion (int n1, int n2, double aP, double ∗PA, double ∗PB, double ∗buffer)

    Compute the McMurchie-Davidson-Hermite coefficients for binomial expansion by explicit recursion. This function makes the same changes to buffers as oepdev::make_mdh_D2_coeff, but implements it through explicit recursion by calls to oepdev::d_N_n1_n2. Therefore, it is slightly slower. Here for debugging purposes.

- void [oepdev::make_mdh_R_coeff](int N, int L, int M, double alpha, double a, double b, double c, double ∗F, double ∗buffer)

    Compute the McMurchie-Davidson R coefficients.

Functions

Rotation of AO Space

19.17.1 Theory

The objective is to find the formulae for rotation matrices of the AO spaces as functions of the Cartesian 3 x 3 rotation matrices. It is obvious that p-type functions transform as a usual Cartesian vectors. However, higher angular momentum functions transform in a more complex way.

Problem

Define a vectorized AO space M of rank r>1 that is constructed from unique tensor components of fully symmetric r-th rank AO tensor populated in standard order,

$$M_{\{ab...k\}} = M_{ab...k} \quad \text{for} \quad a \leq b \leq ... \leq k$$

Given a general rotation of Cartesian tensors

$$M_{ab...k} = \sum_{a'b'...k'} M_{a'b'...k'} r_{a'a} r_{b'b} \cdots r_{k'k}$$

find closed expressions for the rotation matrix in reduced composite AO space obeying

$$M_{[ab...k]} = \sum_{\{a'b'...k'\}} M_{\{a'b'...k'\}} R_{\{a'b'...k'\},[ab...k]}$$

In the derivations below the following identity of first-order partitioning will be of use:

$$\sum_{ab} M_{ab} \hat{s}_{ab} = \sum_{\{ab\}} M_{\{ab\}} \left(\hat{s}_{ab} + \Delta_{ab} \hat{s}_{ba} \right)$$

where

$$\Delta_{ab} \equiv 1 - \delta_{ab}$$

and the operator s of rank r acts as follows

$$s_{a'b'...k'}^{ab...k} \equiv \hat{s}_{a'b'...k'} \underbrace{\mathbf{r} \otimes \mathbf{r} \otimes \cdots \otimes \mathbf{r}}_{r} = r_{a'a} r_{b'b} \cdots r_{k'k}$$

Rotation of 6D functions

The rotation of the full tensor AO space of rank 2 and dimensions (3,3) is given by

$$M_{ab} = \sum_{a'b'} M_{a'b'} r_{a'b} r_{b'b}$$

Applying the identity of first-order partitioning directly leads to the formula for a reduced 6D tensor rotation of rank 1 and dimension (6),

$$M_{[ab]} = \sum_{\{a'b'\}} M_{\{a'b'\}} R_{\{a'b'\},[ab]}$$

where the 6 x 6 rotation matrix is given by

$$R_{\{a'b'\},[ab]} = r_{a'a} r_{b'b} + \Delta_{a'b'} r_{b'a} r_{a'b}$$

Rotation of 10F functions

The rotation of the full tensor AO space of rank 3 and dimensions (3,3,3) is given by

$$M_{abc} = \sum_{a'b'c'} M_{a'b'c'} r_{a'b} r_{b'b} r_{c'c}$$

First of all, notice that one can perform the following partitioning

$$\sum_a \sum_{b \neq a} \sum_{c \neq b \neq a} M_{abc} \hat{s}_{abc} = \sum_{\{abc\}} M_{\{abc\}} \left(\hat{s}_{abc} + \hat{s}_{acb} + \hat{s}_{bac} + \hat{s}_{bca} + \hat{s}_{cab} + \hat{s}_{cba} \right)$$

Then, perform a partitioning of the triple sum,

$$\begin{aligned}
\sum_{abc} M_{abc} \hat{s}_{abc} = &\sum_a \sum_{b \neq a} \sum_{c \neq b \neq a} M_{abc} \hat{s}_{abc} \\
&+ \sum_a \sum_{b \geq a} M_{abb} \hat{s}_{abb} + \sum_a \sum_{b < a} M_{abb} \hat{s}_{abb} \\
&+ \sum_a \sum_{b > a} M_{aba} \hat{s}_{aba} + \sum_a \sum_{b < a} M_{aba} \hat{s}_{aba} \\
&+ \sum_a \sum_{b > a} M_{bba} \hat{s}_{bba} + \sum_a \sum_{b < a} M_{bba} \hat{s}_{bba}
\end{aligned}$$

Using the first-order partitioning theorem and interchanging the dummy indices one finds that

$$M_{[abc]} = \sum_{\{a'b'c'\}} M_{\{a'b'c'\}} R_{\{a'b'c'\},[abc]}$$

where the 10 x 10 rotation matrix is given by

$$\begin{aligned}
R_{\{a'b'c'\},[abc]} = &\delta_{b'c'} \left(s^{abc}_{a'b'b'} + \Delta_{a'b'} \left\{ s^{abc}_{b'a'b'} + s^{abc}_{b'b'a'} \right\} \right) \\
&+ \delta_{a'b'} \Delta_{b'c'} \left(s^{abc}_{c'a'a'} + s^{abc}_{a'c'a'} + s^{abc}_{a'a'c'} \right) \\
&+ \Delta_{a'b'} \Delta_{b'c'} \left(s^{abc}_{/a'b'c} + s^{abc}_{a'c'b'} + s^{abc}_{b'a'c'} + s^{abc}_{b'c'a'} + s^{abc}_{c'a'b'} + s^{abc}_{c'b'a'} \right)
\end{aligned}$$

and

$$s^{abc}_{a'b'c'} \equiv \hat{s}_{a'b'c'} \mathbf{r} \otimes \mathbf{r} \otimes \mathbf{r} = r_{a'a} r_{b'b} r_{c'c}$$

- psi::SharedMatrix oepdev::r6 (psi::SharedMatrix r)

    Compute the 6 x 6 rotation matrix of the 6D orbitals.

- void oepdev::populate (double ∗∗R, double ∗∗r, std::vector< int > idx_am, const int &nam)

    Compute the 6 x 6 rotation matrix of the 6D orbitals.

- psi::SharedMatrix oepdev::ao_rotation_matrix (psi::SharedMatrix r, psi::SharedBasisSet b)

    Compute the full rotation matrix of AO orbital space.

Functions

- PSI_API void oepdev::preambule (void)

    Print preambule for module OEPDEV.

- template<typename... Args>
  std::string oepdev::string_sprintf (const char *format, Args... args)

    Format string output. Example: std::string text = oepdev::string_sprinff("Test %3d, %13.5f", 5, -10.5425);.

- PSI_API std::shared_ptr< SuperFunctional > oepdev::create_superfunctional (std::string name, Options &options)

    Set up DFT functional.

- PSI_API SharedBasisSet oepdev::create_basisset_by_copy (SharedBasisSet basis_ref, SharedMolecule molecule_target)

    Build BasisSet by Copy.

- PSI_API SharedBasisSet oepdev::create_atom_basisset_by_copy (SharedBasisSet basis_ref, SharedMolecule molecule_target, int idx_atom)

    Build BasisSet by Copy for a Particular Atom.

- PSI_API std::shared_ptr< Molecule > oepdev::extract_monomer (std::shared_ptr< const Molecule > molecule_dimer, int id)

    Extract molecule from dimer.

- PSI_API double oepdev::compute_distance (psi::SharedVector v1, psi::SharedVector v2)

    Compute distance between two points in nD space.

- PSI_API std::shared_ptr< Wavefunction > oepdev::solve_scf (std::shared_ptr< Molecule > molecule, std::shared_ptr< BasisSet > primary, std::shared_ptr< BasisSet > auxiliary, std::shared_ptr< BasisSet > guess, std::shared_ptr< SuperFunctional > functional, Options &options, std::shared_ptr< PSIO > psio, bool compute_mints=false)

    Solve RHF-SCF equations for a given molecule in a given basis set.

- PSI_API std::shared_ptr< Wavefunction > oepdev::solve_scf_sad (std::shared_ptr< Molecule > molecule, std::shared_ptr< BasisSet > primary, std::shared_ptr< BasisSet > auxiliary, std::vector< std::shared_ptr< BasisSet >> sad, std::vector< std::shared_ptr< BasisSet >> sad_fit, std::shared_ptr< SuperFunctional > functional, Options &options, std::shared_ptr< PSIO > psio, bool compute_mints=false)

    Solve RHF-SCF equations for a given molecule in a given basis set.

- PSI_API double oepdev::average_moment (std::shared_ptr< psi::Vector > moment)

    Compute the scalar magnitude of multipole moment.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > oepdev::calculate_JK (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Matrix > C)

    Compute the Coulomb and exchange integral matrices in MO basis.

- PSI_API double oepdev::calculate_idf_alpha_xc_energy (std::shared_ptr< psi::Wavefunction > wfn, std::vector< double > w, psi::SharedMatrix D, std::vector< psi::SharedMatrix > AI, std::vector< psi::SharedMatrix > BI)

    Compute the IDF exchange-correlation energy.

- PSI_API double oepdev::calculate_idf_xc_energy (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::Matrix > D, std::vector< std::shared_ptr< psi::Matrix >> f, std::vector< std::shared_ptr< psi::Matrix >> g, std::shared_ptr< psi::Vector > w, std::shared_ptr< psi::Vector > o, double N, double aN, double xiN, double AN, double wnorm)

  Compute the IDF exchange-correlation energy.

- PSI_API std::vector< std::shared_ptr< psi::Matrix > > **oepdev::calculate_JK_ints** (std::shared_ptr< psi::Wavefunction > wfn, std::shared_ptr< psi::IntegralTransform > tr)

Chapter 20

Example Documentation

20.1 example_cphf.cc

Shows how to use the oepdev::CPHF solver to compute molecular and LMO-distributed polariz-abilities at RHF level of theory.

```
void example_cphf(std::shared_ptr<psi::Wavefunction> wfn, psi::Options& opt){

  // build the solver
  std::shared_ptr<oepdev::CPHF> solver = std::make_shared<oepdev::CPHF>(wfn, opt);

  // run the solver to converge CPHF equations
  solver->compute();

  // print the LMO-distributed polarizabilities
  for (int i=0; i<solver->nocc(); i++) {
      solver->polarizability(i)->print();
  }

  // print the molecular polarizability
  solver->polarizability()->print();

  // grab 4th LMO-distributed polarizability and its associated LMO centroid
  psi::SharedMatrix pol_4 = solver->polarizability(3);
  psi::SharedVector rmo_4 = solver->lmo_centroid(3);
};
```

20.2 example_davidson_liu.cc

This example is a trivial demo to use `oepdev::DavidsonLiu` in order to diagonalize a real, symmetric matrix **H**, stored in a `psi::SharedMatrix H`. This can help you to construct more complicated classes that need to solve eigenpairs for very large, sparse matrices such as CI Hamiltonians.

Note

This example might need compile properly (it's only a draft). Debug if necessary.

```
// Define a class that inherits from DavidsonLiu
class Diagonalize : public DavidsonLiu {

 public:
```

```
  Diagonalize(psi::SharedMatrix H, psi::Options& opt, int M);
  virtual void ˜Diagonalize() {};

 protected:
  // Desired number of roots to be found
  int M_;
  // Matrix to be diagonalized (explicitly stored)
  psi::SharedMatrix matrix_;

  // Implementation of pure methods must be declared
  void davidson_liu_compute_diagonal_hamiltonian();
  void davidson_liu_compute_sigma();
};

Diagonalize::Diagonalize(psi::SharedMatrix H, psi::Options& opt, int M) :
  DavidsonLiu(opt) , matrix_(nullptr), M_(M)
{
  matrix_ = std::make_shared<psi::Matrix>(H);
  int N = H->ncol();
  int L = M_;

  // Must be run in order to allocate memory
  this->davidson_liu_initialize(N, L, M_);
}

// Implementation of pure methods
void Diagonalize::davidson_liu_compute_diagonal_hamiltonian() {
 for (int i=0; i<this->matrix_->ncol(); ++i) {
      double v = matrix_->get(i, i);
      this->H_diag_davidson_liu_->set(i, v);
 }
}

void Diagonalize::davidson_liu_compute_sigma() {
 for (int k=this->davidson_liu_n_sigma_computed_; k<this->L_davidson_liu_; ++k) {
      psi::SharedVector Sigma = std::make_shared<psi::Vector>("", this->N_davidson_liu_);
      Sigma->gemv(false, 1.0, *this->matrix_, *Sigma, 0.0);
      this->sigma_vectors_davidson_liu_.push_back(Sigma);
 }
}

// Testing function
void example_davidson_liu(psi::SharedMatrix H, int M, psi::Options& opt){

  // Construct the solver object
  Diagonalize solver(H, opt, M);

  // Find *M* lowest eigenpairs of a given matrix **H**
  solver.run_davidson_liu();
};
```

Working with GenEffFrag objects

At the moment, `psi::Molecule` and `psi::BasisSet` objects do not have Cartesian rotation implemented which prohibits using them as containers in OEPDev. On the other hand, many calculations in FB approaches require molecule and basis set rotation. Therefore, to temporarily overcome this technical difficulty, molecule and basis set objects need to be supplied for each fragment in the system by building them from scratch. Below, the guideline for fragment generation and manipulation is given:

```
// Create empty fragment
SharedGenEffFrag fragment = oepdev::GenEffFrag::build("Ethylene");
// Set the parameters
```

```
fragment->parameters["efp2"] = par_efp2;
fragment->parameters["eet"] = par_eet;
// Set the number of doubly occupied MOs and number of primary basis functions at the end
fragment->set_ndocc(ndocc);
fragment->set_nbf(nbf);
// Set the current molecule and basis set
fragment->set_molecule(mol);
fragment->set_basisset("primary", basis_prim);
fragment->set_basisset("auxiliary", basis_aux);
```

Creating the parameters can be done by using an appropriate factory

```
SharedGenEffParFactory factory = GenEffParFactory::build("OEP-EFP2", wfn, options,
     auxiliary, intermediate);
SharedGenEffPar parameters = factory->compute();
```

Currently, parameters are not created with allocated basis set objects due to the above mentioned problem in Psi4 regarding lack of functionality of basis set rotation. Therefore, **it is important to first set the parameters before setting the basis set** when constructing the fragments. It is because using the set_basisset method for the fragment sets the basis set for all parameters as well, and if the parameters were set after the basis set, they would not have any basis sets allocated leading to errors in FB calculations. This problem will not emerge once a rotation of psi::BasisSet is implemented (either in Psi4 or in OEPDev).

```
void example_gefp() {
//TODO
}
```

20.4 example_integrals_iter.cc

Iterations over electron repulsion integrals in AO basis. This is an example of how to use

- the oepdev::ShellCombinationsIterator class

- the oepdev::AOIntegralsIterator class.

```
void iterate(std::shared_ptr<oepdev::IntegralFactory> ints)
{
  // Prepare for direct calculation of ERI's (shell by shell)
  std::shared_ptr<psi::TwoBodyAOInt> tei(ints->eri());

  // Grab the buffer where the integrals for a current shell will be placed
  const double* buffer = tei->buffer();

  // Create iterator to go through all shell quartet combinations
  oepdev::SharedShellsIterator shellIter =
      oepdev::ShellCombinationsIterator::build(ints, "ALL", 4);

  // Iterate over shells, and then over all integrals in each shell quartet
  for (shellIter->first(); shellIter->is_done() == false; shellIter->next())
  {
      // Compute all integrals between shells in the current quartet
      shellIter->compute_shell(tei);

      // Create iterator to go through all integrals within a shell quartet
      oepdev::SharedAOIntsIterator intsIter = shellIter->ao_iterator("ALL");

      for (intsIter->first(); intsIter->is_done() == false; intsIter->next())
      {
```

```
            // Grab current (ij|kl) indices here
            int i = intsIter->i();
            int j = intsIter->j();
            int k = intsIter->k();
            int l = intsIter->l();

            // Grab the (ij|kl) integral
            double integral = buffer[intsIter->index()];
        }
    }
}
```

20.5 example_scf_perturb.cc

Perturb HF Hamiltonian with external electrostatic potential. This is an example of how to use the oepdev::RHFPerturbed class.

```
void scf_perturb(std::shared_ptr<psi::Wavefunction> wfn, psi::Options& opt)
{
    // Set up HF superfunctional
    std::shared_ptr<psi::SuperFunctional> func = oepdev::create_superfunctional
        ("HF", opt);

    // Initialize the perturbed wavefunction
    std::shared_ptr<oepdev::RHFPerturbed> scf = std::make_shared<oepdev::RHFPerturbed>(wfn, func, opt, wfn->
        psio());

    /* Perturb the system with the uniform electric field [Fx, Fy, Fz].
       Then, add two point charges of charge qi placed at [Rxi, Ryi, Rzi].
       Provide all these values in atomic units! */
    const double Fx = 0.04, Fy = 0.05, Fz = -0.09;
    const double Rx1= 0.00, Rx2= 1.30, Rx3= -1.00;
    const double Rx1= 0.10, Rx2=-0.30, Rx3=  3.50;
    const double q1 = 0.30, q2 =-0.09;

    scf->set_perturbation(Fx, Fy, Fz);         /* set it only once, setting it again will overwrite the
        field, not add */
    scf->set_perturbation(Rx1, Ry1, Rz1, q1);
    scf->set_perturbation(Rx2, Ry2, Rz2, q2); /* more charges can be added */

    // Solve perturbed SCF equations
    scf->compute_energy();

    // Grab some data
    double energy = scf->reference_energy();      // Total energy of the system
    std::shared_ptr<psi::Matrix> Da = scf->Da();  // One-particle density matrix

    /* Note that the external field and charges perturb only one-electron Hamiltonian.*/
}
```
